

Factory Works Hotshot

This chassis set is designed to allow modern Lipo batteries to be used in the Hotshot based series. The chassis is very rigid and yet allows just a bit of flexibility. The chassis slots together and is held with ties to keep it simple and looking era correct.

You can bolt the servo in place as original, or run the ~~Team Associated bellcrank steering set part number 6255~~ included 3d printed bellcrank. We include a long 8-32 button head screw and nuts. The bellcrank is Associated part number 6281. Install as shown in the pic, if using stock tie rods choose the offset hole in the chassis.

When building the chassis, you may want to assemble it first and then transfer parts. Install the rear first. Make sure to add spacers to the rear between the roll bar and gearbox, #4 washers work great. If you are not using the roll bar, use the included black spacers. Zip ties are used to keep the side tabs located.
