

Stealth Adapter for Tamiya KingCab

Remove your existing transmission and plate. Transfer the two plastic transmission posts and bumper. Install the new motor plate on the stealth trans, and install the trans onto the plate using 4-40 x 3/8" long screws. Install the 3x14mm screws through the adapter as shown with plain nuts, and attach the plate to the top of the trans using 4-40 x 1/4" screws as shown. Attach the plate assembly to the chassis using stock hardware. Use the supplied 3mm lock nuts on the two screws that now protrude at the rear. Install your rear suspension sides to the new plate using stock hardware. Reinstall your dogbones and reattach the upper links. The new plate is approximately 4.4mm narrower than stock, so you will need to take that amount out of the upper arms to correct the camber. Install your motor and you should be ready to race!
