

# Email Security Essentials

*Email attacks are growing more complex & more dangerous. Recent studies have shown that 97% of users are not able to identify a sophisticated phishing email, causing 85% of businesses to suffer from phishing attacks.*

- **More than one layer of protection is necessary when securing email environments, most email protection services only offer one layer of security to filter threats from outside email addresses but aren't able to stop threats from an internal account that has been compromised.**

**Gaps in your email security could cost your business more than just money.**

- **When you apply artificial intelligence to your email security, you receive insight into any oddities delivered to your email. By analyzing your businesses' behavioral and communication patterns AI email protection will identify and alert you to any malicious activities occurring within your business.**
