be present in source water include: up substances resulting from the presence of animals or from human activity. Contaminants that may ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the The sources of drinking water (both tap water and bottled water) include rivers, lakes,

Microbial Contaminants - such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic Contaminants - such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and Herbicides - which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses

Organic Chemical Contaminants – including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

Radioactive Contaminants - which can be naturally-occurring or be the result of oil and gas production and mining activities

want to learn more about your drinking water, please contact SHELLY G HORTON at 318-965-2781 utility. If you have any questions about this report, want to attend any scheduled meetings, or simply same protection for public health. We want our valued customers to be informed about their water Administration regulations establish limits for contaminants in bottled water which must provide the amount of certain contaminants in water provided by public water systems. Food and Drug In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the

lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested components. When your water has been sitting for several hours, you can minimize the potential for providing high quality drinking water, but cannot control the variety of materials used in plumbing associated with service lines and home plumbing. TOWN OF BENTON WATER SYSTEM is responsible for women and young children. Lead in drinking water is primarily from materials and components If present, elevated levels of lead can cause serious health problems, especially for pregnant

available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is

water, including bottled water, may reasonably be expected to contain at least small amounts of some show the results of our monitoring during the period of January 1st to December 31st, 2023. for constituents in your drinking water according to Federal and State laws. The tables that follow contaminants. The presence of contaminants does not necessarily indicate that water poses a health The Louisiana Department of Health and Hospitals - Office of Public Health routinely monitors Drinking

To help you better understand these terms, we've provided the following definitions: In the tables below, you will find many terms and abbreviations you might not be familiar

Parts per million (ppm) or Milligrams per liter (mg/L) – one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter (ug/L) - one part per billion corresponds to one minute in 2,000 years, or a single penny in

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

ensure control of a contaminant. <u>Treatment Technique (TT)</u> – an enforceable procedure or level of technological performance which public water systems must follow to

Action level (AL) - the concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must

Maximum contaminant level (MCL)—the "Maximum Allowed" MCL is the highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG's as feasible using the best available treatment technology.

Maximum contaminant level goal (MCLG) – the "Goal" is the level of a contaminant in drinking water below which there is no known or expected risk to human health. MCLG's allow for a margin of safety.

Maximum residual disinfectant level (MRDL) — The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants. Maximum residual disinfectant level goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk

been found in our water system. Level 1 assessment – A study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have

violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions Level 2 Assessment – A very detailed study of the water system to identify potential problems and determine (if possible) why an E. coli MCL
