**Geozip** = first 3 digits of the zip code

**FAIR Health Ave. Allowable:** the average in-network amount (*not* charges) paid by commercial payers for that service (CPT code) in that same geographical area (geozip)

**CPT** = medical code set used to report procedures and services performed by providers

**99283, 99284, 99285** = the 3 most severe emergency visit codes, which make up over 90 percent of ER visits.

For context, a 99283 could include examination and treatment of a more minor head injury or limb trauma requiring X-ray. 99285 could include diagnosing and treating chest pain or stroke. (99281 and 99282, which are the least severe, make up about 5% of visits, and are most often treated in a primary care or urgent care setting).

**99291** = Critical care code, which is time-based, and defined as a physician's delivery of care for a critically ill or critically injured patient (considered to be severe enough that without urgent intervention, would likely result in sudden life-threatening deterioration in the patient's condition).

For context, a 99291 would be typically used for treating things like kidney failure, liver failure, or respiratory failure.

**Distribution of code frequency in Medicare**  
(NOTE: commercial insurance will have some variation from this)
