

E 50-H

FOR HAIR

By PrimaCure

Developed in Korea.
Derived from Salmon. Designed to Revive.

E 50-H is a professional topical program developed in Korea and powered by salmon derived exosomes. Combined with peptides, growth factors, and scalp supporting actives, it helps improve the look of density, restore scalp vitality, and support the appearance of thicker, healthier looking hair.

Observed Improvements with E 50-H For Hair

What benefits can I expect from E50-H Hair?

E50-H Hair, powered by salmon-derived exosomes and advanced bioactive factors, revitalizes the scalp environment to promote thicker, stronger, and healthier hair growth. Applied professionally after microneedling, it enhances absorption and optimizes follicular activation. With continued use, E50-H Hair supports:

- Improved scalp health and microcirculation for stronger roots.
- Increased hair density, thickness, and overall vitality.
- Reduced inflammation, irritation, and scalp sensitivity.
- Restoration of balance for a refreshed, healthy scalp environment.

How soon can results be seen?

Noticeable improvements in scalp comfort and vitality can appear within the first two weeks. Visible increases in hair density and thickness are typically observed after the second session, with progressive results continuing over 6–8 weeks.

How often should E50-H Hair be used?

For optimal results, E50-H Hair should be applied following the recommended protocol: Day 1, Day 15, Day 45, Day 75, and Day 105. This sequence promotes continuous activation of scalp function and follicular regeneration.

After completing the initial program, maintenance sessions every 3–6 months are advised to sustain the strengthened scalp environment and preserve hair growth and density.

Regular use helps maintain long-term scalp vitality and ensures lasting improvements in thickness and overall hair quality.

Are there side effects?

E50-H Hair is generally well tolerated. Mild redness or sensitivity may occur at the microneedling site, resolving within hours. No irritation or discomfort has been observed in clinical safety assessments.

Always consult a qualified professional for post-procedure guidance.

How does PrimaCure ensure the integrity of E50-H Hair?

Each batch of E50-H Hair is verified through the EVSTA (Extracellular Vesicle Standardized Tracking and Analysis) system to confirm concentration, purity, and marker presence (CD9, CD63, CD81, HSP70).

This ensures consistent quality, safety, and exosome bioactivity, delivering dependable performance with every treatment.

E 50-H

2-step system:

Dry Ampoule +
Solvent Ampoule

When combined, the two ampoules create an optimal environment for scalp vitality and healthier-looking hair.
