THE USE OF THZ RADIATION FOR A NEW TYPE OF CORONAVIRUS INFECTION COMPLICATED BY PNEUMONIA

In this study, 12 patients aged 44 to 67 years with diagnoses U07.1 + J12.8 were dynamically observed in the early rehabilitation period at the inpatient stage. Patients, residents of St. Petersburg, were hospitalized in medical institutions of the city with signs of respiratory failure, dry cough, weakness and hyperthermia. After hospitalization, the diagnosis "COVID-19, virus identified" (code U07.1 - <https://icd.who.int/browse10/2019/en#/U07.1>) was confirmed. According to the results of computed tomography (CT), according to the indicators of clinical and biochemical blood tests (with markers of inflammatory processes), the diagnosis was clarified and supplemented with community-acquired bilateral polysegmental pneumonia and first-degree respiratory failure (another viral pneumonia - code J12.8 - <https://icd.who.int/browse10/2019/en#/J12.8>) as a complication of the main one.

Patients examined taking into account age, gender, main diagnosis, complications and clinical symptoms were divided into two groups compared according to these parameters: the main group (MG) and the Control Group (CG). Patients in both groups received antibacterial, anti-inflammatory, symptomatic, antiviral and gastro-protective therapy. In addition to the pharmacotherapy in the early rehabilitation period, patients with OG underwent a course of THz-therapy using the "IR-Dipole" apparatus in the amount of 10-12 procedures until they were discharged from the hospital. Patients of both groups, 6 people in each (3 men and 3 women) were hospitalized 3-5 days after deterioration. They had no history of thyroid disease or changes characteristic of the pathology of this organ revealed during the examination. The main comorbidities in the group were degenerative-dystrophic diseases of the spine (DSD) without clinical symptoms requiring drug treatment. All patients had no bad habits. According to CT data, all examined patients had multiple extensive merging foci of irregular-shaped infiltration of the "ground glass" type in all segments of both lungs. The total lesion volume exceeded 50%. The data of clinical and laboratory blood parameters in the groups are presented in tables 2-4.

iTeraCare™

SO EFFECTIVE IN HELPING COVID-19 RECOVERY

Ms. Aida Patana from Philippines.

She got severe Covid-19, admitted 25 days in the hospital. She was breathing thru the help of oxygen tank. According to the doctors, her recovery might take 3 months due to severe complications. 🤔

Then she discovered iTeraCare Device. After her 1st 40-minute therapy, she was able to breathe comfortably and used it for 1-week straight. now she's finally well, no more oxygen tank and took her less than 2 weeks to fully recover from Covid-19.

Thank you Iteracare Device. 🙏☀️👏

"Pic taken on 12th Sept 5 days after using iTeraCare device. 20% lump reduced 80% pain relieved."

" Pic taken on 29th Sept 2021, 22 days after using iTeraCare device. 30% lump reduced 90% pain relieved."

Terahertz radiation may offer a potential treatment for cancer

Reviewed by James Ives, M.Psych. (Editor)

Jun 2 2020

Researchers from the RIKEN Center for Advanced Photonics and collaborators have discovered that terahertz radiation, contradicting conventional belief, can disrupt proteins in living cells without killing the cells.

This finding implies that terahertz radiation, which was long considered impractical to use, may have applications in manipulating cell functions for the treatment of cancer, for example, but also that there may be safety issues to consider.

Terahertz radiation is a portion of the electromagnetic spectrum between microwaves and infrared light, which is often known as the "terahertz gap" because of the lack so far of technology to manipulate it efficiently.

Because terahertz radiation is stopped by liquids and is non-ionizing--meaning that it does not damage DNA in the way that x-rays do--work is ongoing to put it to use in areas such as airport baggage inspections.

It has generally been considered to be safe for use in tissues, though some recent studies have found that it may have some direct effect on DNA, though it has little ability to actually penetrate into tissues, meaning that this effect would only be on surface skin cells.

One issue that has remained unexplored, however, is whether terahertz radiation can affect biological tissues even after it has been stopped, through the propagation of energy waves into the tissue.

The research group from RAP recently discovered that the energy from the light cold enters into the water as a "shockwave." Considering this, the group decided to investigate whether terahertz light could also have an effect like this on a tissue.

They chose to investigate using a protein called actin, which is a key element that provides structure to living cells. It can exist in two conformations, known

Serum Creatinine 8.2 to 2.8

iTeraCare Therapy Device

Blow directly on the kidney and spine and drink lots of charged water.

74 year old Man in dialysis 3 times a week. On the first day, after 2 treatments, he was able to urinate a little bit. And today, he can urinate 3 times a day, which means his kidney function is slowly rejuvenating back! 9 days with iTeraCare blowing & drinking charged water.

**Blow directly on the kidney and spine
and drink lots of charged water.**

**After 2 months of using the iTeraCare
Device**

OSTEOPOROSIS

2 months before the therapy

93 year old lady with severe osteoporosis.

Nerves impingement causing great pain. Unable to even move an inch. She has to remain in bed. This was 2 months ago. Now today, she can even do the track cycle after doing our iteracare blower therapy twice a day for 2 months till today. She can even lift her leg to do karaoke with great ease. Marvelous recovery. Thanks to our wonderful iteracare blower.

THANK
YOU
