

Liposana is a Complete Fat Solution

Not a synthetic, not just a matrix, and not just growth factors. Because it is real human adipose tissue, it remains structurally and biologically intact, providing the essential components required for adipose repair, replacement, or restoration.

- ✔ Intact extracellular matrix (ECM) – preserves the tissue’s natural scaffold
- ✔ Native growth factors – support a patient’s natural healing process
- ✔ Intact adipocytes – provide volume and cushioning immediately at implantation

Liposana provides immediate and long-lasting offloading—it becomes remodeled by the patient’s own cells over time.

“Biological Boot” Effect

Upon implantation, Liposana behaves like a biological boot—providing immediate structural support, volume, and cushioning.

- ✔ Immediate cushioning and shock absorption
- ✔ Redistribution of plantar pressure
- ✔ Prevention of additional damage to plantar soft tissue

Liposana provides immediate and long-lasting offloading—it becomes remodeled by the patient’s own cells over time.

Total Tissue Repair

Liposana supports a patient’s natural healing process to enable complete repair of damaged tissue.

- ✔ Facilitates native tissue restoration
- ✔ Provides structural support for underlying tissues
- ✔ Promotes long-term functional outcomes

Liposana addresses the root causes of damaged tissue—not symptoms.
