all actual patients

take control

I can & I will

WHAT IS IT?

Semaglutide is a modified molecule our bodies make called GLP-1 analog. It works by increasing insulin production and lowering glucagon secretion as well as by targeting areas in the brain that regulate appetite and food intake. A small change in the molecule allows the drug to last for weeks in our bodies rather than the natural version our bodies make, which only lasts minutes.

MORE SIMPLY?

Semaglutide:

- *Delays how quickly our stomach digests food leading to a feeling of fullness with smaller portions
- *Slows intestinal motility so you feel fuller longer
- *Lowers blood sugars, in part by reducing the production of sugar in the liver
- *Stimulates insulin secretion by the pancreas

ADDED BENEFITS?

- Lowers A1C
- Improves Sleep
- Good for heart health
- Lowers cholesterol and blood pressure
