

## GLUTATHIONE INJECTION INFORMED CONSENT IV/IM

I, \_\_\_\_\_, hereby authorize **Drenched Hydration-Beauty + Wellness LLC** or assigned clinical representative to perform the following IV procedure:

Glutathione IV or Intramuscular Injection on myself. A licensed clinician has verbally reviewed the following risks, benefits, contraindications and precautions with me.

Possible BENEFITS of Glutathione:

- Useful in any condition where there is risk for oxidative damage.
- Useful to possibly prevent radiation injury BEFORE radiation treatment is started.
- Important chelator for lead, mercury, cadmium, and arsenic
- Important role in immune function via white blood cell production and is a potent antiviral agent.
- It is possibly one of the strongest anti-cancer agents made in the body.
- Glutathione levels decrease with age. Glutathione is involved in cellular differentiation and slows the aging process.

Possible RISKS of Glutathione:

- Possible allergic response to IV/IM Injection of glutathione.
- Theoretical interaction with Chemotherapy and/or Radiation therapy thereby decreasing effectiveness of those treatments.
- Contraindications:
- Possible theoretical contraindication in conjunction with cancer chemotherapy and/or radiation but this is controversial.
- Known allergy to glutathione
- Asthma, especially uncontrolled asthma

Possible Side Effects:

- Hexhemer reactions: body aches, nausea, and occasionally headaches, mild diarrhea and chills without fever.
- Anxiety
- Allergic reaction Keep in mind that some of these (Hexhemer reactions: body aches, nausea, and occasionally headaches, mild diarrhea and chills without fever), fatigue skin eruptions flu-like symptoms, can be due to detoxification effects stimulated by Glutathione.
