

Integrated Assistance for Azure SQL Database

Integrated assistance provided help with new features in early versions of Azure SQL Database. In this example, user data indicated customer frustration with the new Query Plan feature, so we developed additional help and made it available right inside the user interface.

The Help Blade provided a summary of the feature, a video demonstration, and links to additional help. Users could also drag the Help Blade frame to a second monitor, enabling them to view the video and read documentation while using the feature.

1. Click **Learn more about Query Plans...** to launch integrated assistance.
2. Read a quick overview of the feature at the top of the frame. Click **More...** to expand the overview section.

Below the overview, Help Blades present a variety of information:

- Click **Watch a video** to see an SME demonstrate the feature.
 - Click **Visit the community** to connect with other users and wiki topics.
 - Click **Related information** to see links to the full set of overview content, how-to topics, and a troubleshooting guide.
 - Click **Support** to be connected to Microsoft technical support.
3. Click the **x** at top right to close the Help Blade.
