Enabling surgical precision and optimizing performance

SENSEI® is an advanced guidance system designed for minimally-invasive and robot-assisted radio-guided surgery. Using next-generation miniaturized sensor technology, the system's gamma probe measures just over 40mm in length for unrivaled intracavity and anatomic reach. When used with an articulating grasper, the miniature SENSEI® probe expands the field of view and enables the quick localization of radioactive hotspots in multiple locations. With such advanced dexterity and maneuverability, SENSEI® optimizes performance for unprecedented surgical precision.
