

A rocket and a flying saucer are different things

- What is rocket science?

Illustration: From A to B

Let's be clear; combustion engines will not be an option for interstellar travel. With a vehicle that's able to do interstellar travel, there are certain components missing for such an achievement. CQ is one of them. But maybe more important might be the [positronal layer](#). The layer that resonates with the realm of the vibrations/frequencies making electrons appear, and their work for everyday mission for you to exist, can be given access to. In short terms.

The images of our universe, which frankly can remind you of a structural nervous system in our brain, have these pathways and areas where the positronal layer reigns the most. Hereby referred to as the highways in our galaxy. To hack such an ability, we need the resonating vibrations to use its force field. Both for speed and protection. Ok.

[The CQ required](#) seems to respond closer to 49,99. If you see possible calculational results of the equation 'Time - a theory' it will give you a result of how many electrons get transferred at every moment as a result of your own CQ.

- Higher the CQ - the lower need to produce, and production-*Space is for explorations*
- Lower the CQ - the higher need to produce-*Humans are not capable of creating anything at a galactic level*
- This is a result of operational systems ruled by lobbyism & \$ - *we all have contacts*

If you have ever seen a flying object behaving strangely, either with your own eyes or in a video, you can often see something similar to a flying single lightbulb. This might be a result of a system that uses this field as some form of energy field. The more the [positronal layer](#), the more coherence with the resonance of the 'electron vibrational field' which creates photons (light particles). You basically have a light show going on in other words, and the ability to travel a more technological way. This is of course not profitable for some gentlemen on Earth but we are getting there. GEC is pretty sure that there will be interference at a higher level than those who have clearance to "push the button", which is not quite correct. There is no 'one red button' who can complete this one single act.

Let us all make it a competition(?): Who can show off their first flying governmental object who can triumph over classical physics rules? It must surely become one of the greatest nations. Unless it is miscalculated, am I wrong?

This subject will most likely be continued, and this document is referred to as up-to-date knowledge and might not correct in our future. But it might be a start towards freeing ourselves from this prison planet and its illness.
