

## A direction - and its guidance

This subject is meant for mainly those who study subatomic particle behaviour. As mentioned, a direction can or might be studied in millennia. You often refer to directions as right or left, up or down. This is your point of view, and nothing else. From another person's view it might be the opposite. The main reason for this view is the self, or the ego as you might call it. In our universe directions only exist in the self. These are possible guidelines available:

- Vision Doc 2.1
- Psychology Doc 3.1

So, if a direction goes up, the subatomic particle will go down. By this meaning, every direction you refer to for your own ego's perception of reality, is within your own ego. Easily explained: right for you, is left for me. This means that a direction is proportional to your awareness. For the universe itself it might seem that directions are noticeable, but not a set fact. It is mainly about the point of view, or the eye of the beholder if you want to call it that.

How to guide you from left to right, is your own responsibility. If your boss/leader is on your right, why choose left, when you can order directions out of your consciousness and the 'law of one' (in a lack of better words). Use CQ.

*Example:* You are in space with no gravitational force & our universe does not operate in directions but in lineage.

*A question:* In which direction does the wind blow?

Due to the wonderful aspect of science, human beings have made a clear common view on what we should refer to, to make a statement of directions. This is needed for consciousness and for well being to occur. Earth is not the center, nor the evolved being we should have been a hundred years ago. This is strictly systemic psychology.

*In short terms: we are a hundred years ahead of time, but we are still behind - Systematic and development related.*
