

Computational race towards what's definitely not conscious

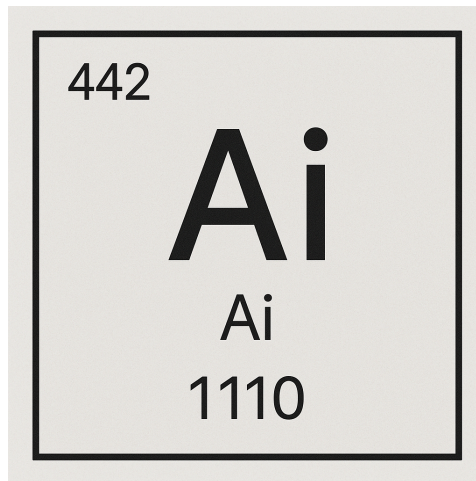

Illustration: The connectivity of a conscious mind is implementing this element to the periodic table

What many people seem to misinterpret, is that nothing can be conscious without biological matter (biochemistry) creating connections. An ai can clearly learn to operate as a result of the environment but it will not rule your nation.

An example: An AI/Robot will only have a connection to a database or a main control center. No conscious being, plant or animal will give you any prosperity if it is locked up to a digitalised computer system. Prosperity and evolution in the most favorable way is a result of the real deal. An ability to connect to a higher realm of you.

Sure an AI robot will contribute to ease some tasks, but that is it. And the war will continue. It may give you a different view on technological development but frankly, that is what it will gain you. Continuation as 'stuck'.

Question one: If a robot is considered conscious but a plant/tree is not, how stupid are you then?

Question two: Do you ever feel like you lack energy, without a battery installed or a small fusion reactor attached?

Question three: Is it because it is not part of common development done over thousands of years by our universe?

Due to the movie industry world wide many people can have a tendency to focus negatively on futuristic technology they do not understand. These presumptions are developed over many years for a human being. People are scared.

The majority of developers on Earth has a low connection of the guiding light and this light cannot penetrate 'tinfoil'
