

## AI and Education, part two

### Children and society

Let's say that interactions between humans are difficult because of the result on how AI affects our lives. Change can create fear, and fear can create a hostile point of view towards our nearest environment. Amygdala detects danger towards the physical, AI's has not yet done this.

In the age of AI's, it seems more important to what it actually can do vs. how we actually interpret a futuristic society. Adaption and further development as part of the human mindset, is important.

Times have always been changing. The movement of interaction is caused by Time. Time is out of our control. What is in our control, is our interpretation and adjustments to Time, and how society operates around the flow of Time and its changes.

For memory wise instructions; you need to implement different AI's to get the fully describable information along with a picture or a video to trigger the memory center in the best way. This is why information can be lost in translation. Will AI make us remember information worse than what we have had before? Most likely, no. At least if you have an interest in the information you are reading. With AI's and information growing, so will the interest of specific subjects. It seems. Humans have not changed that much in the last ten years, and we are curious beings. We love to learn.

The danger lies within those who do not know how to use AI's, such as children with no parental advice.
