

Possible Origin of life (consciousness required)

A short introduction

Necessary for development of life (Humans / Earth):

- $C_5H_{12}N_2O_2$
- Cyanobacteria
- ACC1 + ACC2 (a result of algae)
- Nitrogen, Hydrogen and Oxygen (a result of pressure on metal)
- Sulphur (S8)

Consciousness is a driven force, as with gravity and electromagnetism. This hypothesis is a result of information available in 2023. To create conscious beings certain factors are needed. How to develop properly is for our galaxy to decide. By this I mean; in what kind of position is your star system(?). The factors above seem to be many places in our galaxy, and the main factor is electromagnetism. Electromagnetism is a force or existence of holographic matter, along with the gravitational vibrational force. Underlying factors as these are therefore not on the list.

Necessary for a universe:

- Consciousness (oscillating source)
- Gravitational waves
- Electromagnetism
- Information from black holes
- Structured metabolism
