

Possible quantum computing usage for a brighter future regarding humanity and our development

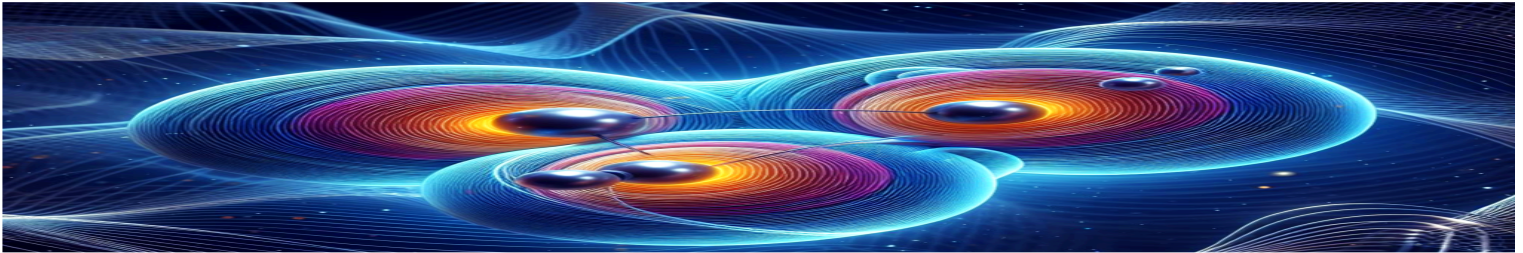

Illustration: *What an equation tell us about energy required is never fulfilled, making them stretched into other dimensional options*

Question: How should we develop quantum computers which have a delegated task for only human futurism?

This is a question Google has asked, probably amongst other developers also. A possible guideline follows:

Quantum Computing explained easily (in short terms):

- Regular computing: exists of 0 (down) and 1 (up). Also called digitalisation and/or programming.
- Quantum computing: 0, 1 and both at the same time, giving us a third possibility. This third possibility is a result of quantum entanglement and particles sharing information which also is affected by the temperature. Temperature is a result of wavefunctions operating often in distance, lambda-wise or as a result of electromagnetism as a start for further understanding. Strong force involved, also. Space between it.

Every equation we have on Earth regarding bigger questions as to how we can understand our universe and the environment we are experiencing can literally be enhanced. It can be enhanced by questionable people, implementing understandable solvents of how the specific equation actually is functioning. Life contributed.

So, by this meaning, the necessary equations implemented can be further explored by implementing another factor. In many cases, not all of them, the added factor should be wave function related like an amplitude or type of wave function. Here is where the quantum computer might contribute to possibilities or impossibilities. The wavelength.

As the search for what particles are, or how they behave, we have come to a point of view where wave functions are critical. Is it a wave, or is it a particle in other words. In many phenomenons it might be both. A 'particle' as a wave.

Note: rotations/spins can be converted into wavelength. Wavelength can be converted into a type of force.

Suggestion: Implement string theory or general relativity for that matter into quantum computers and add the missing amplitude converting results to possible wave functions. These wave functions will also operate inside the mind, the body, and the experience. We can learn more about ourselves, how we operate and how to evolve.

Amplitude implemented is equal to energy required for life itself, maybe
