

Systemic climate change adaptation 201

Illustration: Khan Tran (Hope you are well)

Inflation: Regarding economy and inflation as many countries experience today. It is a result of NATO (10.2023).

An example - If Norway decreased/lowered the interest rate we have today, and every business in this country lowered their price on their products (as a result of interest rate reduction), inflation is solved truly in this country. This is something that will not happen because of the psychology of the human. Money equals safety. Basically.

A question: Would you lower the price of the merchandise/product you sell to prevent inflation in 2029?

The reason; humans always want more and more, creating a possible new inflation within the same intervals we have seen for decades. The economy seems not properly engineered. It will never become stable when it is built by humans for growth. By this meaning: Growth in an unstable market value will most likely never be stable because of the interest rate set by the banks. It is called fractional reserve banking. Stability or not, seeking growth is 0.1.

We are back to 101 on this subject, unfortunately. Your wealth is not actually yours. It belongs to the system.

Possible guidelines:

- **Systemic climate change adaptation 1.1**
- CQ 201
- CQ 301

To make the economic system sustainable: You get one question regarding this: decades of something that should by now be stable, what are your thoughts and where have you invested? Most likely not in those who actually seek stability, peace and prosperity. You have invested in money, a fictional psychological matter not reliable.

Sustainable as a term, means healthy. What we have seen so far, by decades of information, triggering thoughts of how healthy this system is for the people. Those who have a lot can eat well, and live well. Those who have little can not. Wealth then equals well being, and well being equals to not care about others. Technology not implemented.

Growth is not stable. Stable in economy meaning equilibrium. By equilibrium meaning that the amplitude should not get higher, and the mentality of what we have, is what we need to develop a healthy pace of rate. If the focus is on more money, the focus is on the ego. Our money will never get us into interstellar traveling because this is not how it works in outer space, obviously. The currency on Earth seems to be set as information to relate to for others.

An example: It seems silly to believe that you can get somewhere further in space with the dollar, the ruble or the yen. It is a trade technology functional society out there. 'Money' is for underdeveloped nations on planets.

So, use your current energy to build a sustainable nation, for the nation. Considering sustainability, for the people.

Globalization in the 20s seems to be a whole lot of waste of both power, money and knowledge. We can not be globalized with all the different legislations and regulations operating between all of the land borders. We can think in those terms, but in reality it does not function properly. The reason might be cultural, and of course survival.

To regulate the economy seriously at a high level, there is a great need for the understanding that increasing / decreasing interest rates will only create chaos. Philanthropies and the elite already know. The problem is that they do not have a good answer or a solution for the people. Quite easy actually. They might not understand the future.

Economy as we know it stagnates on 101.
