

How quantum gravity affects visible light/photons

Illustration: Patterns, symmetry and photons create what we have (flower of life)

Possible guidelines:

- [The Positronal Layer \(LH4d - Hidden layer\)](#)

How photons/light are being perceived is solely up to the vision. We have eyes which can detect some of the light we have. Infrared can detect other parts of the spectrum and convert it into our visible senses, and as a human being sound can be used for a lower frequency sensory possibilities for the human also. Mass is vital for understanding.

An example:

There is a symbiotic relation regarding particles or photons. It is called quantum entanglement. The best way to experience this is having no light in your house when the sun sets. It will drag your light out of your environment and it will be clear that there is more light outside your living room. This is a result of your windows, walls, and holographic matter, for that matter. The light prefers to stay 'outside', because of construction angles and material alongside albedo, which make the visible light not be able to reach every angle. Amount is vital for understanding.

Remember that as a human being we can only experience such a small amount of these wavelengths.

So, light can emit and it can more importantly retreat. It retreats towards areas consisting of more photons. In any way regarding spectrum or wavelength. Albedo can be used for such an experiment. Reflection will send it right back in various directions. It retreats. Back to its fundamental position. Movement is vital for greater understanding. If you do math, the light will attach to darkness and it will repel the environment for you as a conscious being. This is how quantum entanglement works in short terms. Only that this phenomena operates outside what we are able to describe when it comes to time and space. By this document it is referred to as the positronal 'layer'. This is where entanglement is born, outside our known physics. If quantum gravity can be seen as holographic surface structural tension, it seems clear that it is not only operational, but also the creator. It creates what we are able to experience.

Question: We have to implement the size in order to get further. So, what's the size of your living room and when does your place come to a time where light is being pulled out of your space (with only natural light)?

This can differ from quantum gravity and electromagnetism. There is a ratio related situation between the two of those going something like this: Something pushes, something keeps, and something is pulling, described in very short terms. If you look at our universe as a whole, you get a vacuum out of this relationship (considering spacetime/amount of holographic mass-ratio we can experience with our vision) and therefore also structure.

Photons will exist at every wavelength alongside with holographic matter, at every given moment.
