

Surgical Area Electrolysis MTF & FTM

Client needs a minimum of 12 months treatment. This allows for at least 4 hair growth cycles and a more successful outcome.

The number of treatments is variable depending on the clients' physical threshold and their financial ability. A typical "full" clearing would consist of the entire mapped area being treated and the electrologist making area free by the end of service. **This is not to be confused with 4 treatments.**

On average, the typical session will be an average of 6+hours. This could go longer or shorter based on the client's hair in the area. Best results will yield from a client that can have the entire mapped (see surgeons picture graph) area treated fully in each session. This way we know that no hairs were left previous growth cycle. Each treatment time gradually is less than before. If this is not possible, the 12-month time frame will be pushed out further. Clients that have a "full" clearing should return for another "full" clearing in no more than 6 weeks.

The hair being treated in the genital area is thicker and more persistent then other hairs on the body. This makes for a stronger treatment of each individual hair.

Please sign in acknowledgement _____ Date _____

*Initial the following in acknowledgement

____ I understand that a minimum of 12 months is required for hair removal prior to surgery.

____ I understand that each individual will require a different treatment plan which can, but is not limited to: length of treatment sessions and number of sessions.

____ I have received and understand my treatment plan.

____ I understand that if changes are made to my treatment plan, my time frame for completion will be altered.

____ I understand that not completing the 12 month minimum may result in undesirable hair growth and that hair removal postoperatively is **near impossible** to address.
