

The models are changing, just as we said & for what we said for this week + something bigger brewing for early December (cold/snow) . . .

And then, as if by magic, the last several GFS runs stay rather cold and turn wintry with snow prospects on at least higher ground later this week and potentially in parts quite far south (Wales/Central Regions) from around early Friday and into this weekend and Saturday 28th November and our original and repeated dates for this timeline of around "November 28th and December 5th/6th" . . .

Additionally, the main third-party models, particularly the GFS, are now also strongly repeating and hinting at something substantially colder and much more wintry for ALL (UK & Ireland and north and south) just outside these dates and after December 6th on present indicators and after another cold week with hard and widespread frosts for many during next week.

This is also something that we think will intensify and potentially push forward in timings between now and then for early December.

This is also just as we covered in our last several updates on this by stating the following about "precipitation" and "unsettled" changes from the main models for these exact dates of around "November 28th" and also before turning wintry and to snow and for specifically when the models from elsewhere indicated otherwise in the below digitally-

dated postings:

https://www.facebook.com/share/p/1JZs24jNTB/

https://www.facebook.com/share/p/18eL5muHJV/

I'm sure you all appreciate the accurate heads-up on this again, everyone, but judging by the lowly and received numbers on both of the posts ABOVE, they were more than likely 'not believed' on our part, in comparison to the incorrect and now changing forecasts that were being spouted from elsewhere at the same time but with way more attention and likes on their posts than our much more accurate and less 'believed' forecast details for this same period, and as per usual on our part and for many others to now start taking false accreditation for something they clearly did NOT forecast once again (credit when credit is due seems fair to me) . . .

Additionally, our update prior to the weekend and during last week also stated the following in reference to this exact scenario unfolding this week and how the third-party models would change because of this:

"Also, it could be early to the middle of next week before they (main third-party models) really start to recognise and incorporate these types of projections for cold conditions and snow via their and your apps for this same period . . ."

"Additionally, this is something we think will intensify nearer time and for our exact dates of occurrence for "late November and early December" in combination with 'colder weather conditions' sitting in and infiltrating across our shores once again, and also in terms of increasing snow and widespread snow projections from elsewhere due to a more southerly driven jet stream from the north and expected weather features on our part (north and south of the country and UK and Ireland) . . ."

https://www.facebook.com/share/p/1H1gvss1FD/

Take care everyone, and it appears the cold weather conditions are here to stay after all and before intensifying later for some time yet (just as our several-month reports have reported upon repeatedly and for November and for when the first colder than average month for 2026 will occur on our part),
