

New: Turning More Unsettled & Wintry Across The North From Midweek + Colder For All Later . . .

The upcoming week will see the residence of high pressure residing across our shores to bring a more unsettled few days by midweek and after some mist and fog patches in places to begin the week.

By Tuesday, it will see low pressure bringing rain and showers to parts of the south and south-west of the country and later to parts of the east and possibly around Wednesday and with showers and gales developing in parts further north or the far north that are also likely to turn wintry and to snow across higher ground for around Wednesday/Thursday and possibly to some higher elevations in parts of England as well as Scotland/far north.

After this unsettled period, rain/showers have passed and, from around Thursday and Friday, we will begin to see things turning much colder from a more northerly direction and also inducing some widespread frosts and fog for many throughout late next week and with the continuing risk of wintry showers at times across the far north.

This will also pave the way for further colder temperatures and increasing wintry and

snow prospects elsewhere as we head through the rest of November and for specific dates and locations already covered within our much earlier reports for November as a whole.
