

EXACTAWEATHER

STORMY/UNSETTLED WEATHER CONTINUES
Before Becoming More Settled Later...

STRONG WINDS & HEAVY RAIN

MONDAY
Further Heavy Rain & Stronger Winds

TUESDAY
Showers, Windy & Mixed With Some Sunny Spells

MIDWEEK - NEXT WEEKEND
High Pressure Takes Over (For Now)

Another NAMED STORM/ WINTRY BLAST In Early November?

After a weekend of battering down the hatches for many, Monday will continue with further **heavy rain** and more moderate to **strong winds**, as low pressure dominates.

Heavy showers and windy and mixed/sunny spells will continue, particularly in the north and west of the country and Ireland, with some sunny spells further southwards.

From midweek and Wednesday high pressure will take over and dominate proceedings from next weekend, bringing some mid-autumn **sunny spells** and much cooler, chillier evenings. **Fog** possible in some coastal areas.

Stormy/Unsettled Weather Continues Before Becoming More Settled Later ... + Another Named Storm/Wintry Blast In Early November?

After a weekend of battening down the hatches for many, the new working week will continue with further heavy rain and more moderate to strong winds for many on Monday as low pressure continues to dominate before giving way to some sunny spells in places further southwards later in the day with continuing heavy showers and windy and mixed/sunny spells also continuing as we head into Tuesday, particularly in the north and west of the country and Ireland.

Our most recent short-to-moderate range public weather updates (see provided post from 7 days ago below) also clearly covered high-pressure-influenced weather returning across our shores after at least several days of "majorly stormy weather" and "named storms" on our part.

<https://www.facebook.com/share/p/1XZiZk4nPx/>

This is also still true and valid on our part, as from in and around midweek and Wednesday will see high pressure taking over and dominating proceedings from here and into next weekend and, as some of the latest third-party runs also clearly demonstrate.

Importantly, we can't be overly sure of how far north this high pressure will actually extend to in terms of conditions on the ground over this period and some places may still see some mixed

conditions or showers and even breezy conditions at times in the north or very far north amid some developing sunshine.

However, overall there is a good to high chance it will settle down in many parts with some mid-autumn sunny spells from midweek and over several days into next weekend and with optimum conditions for some much cooler and chillier evenings in this same period and also fog possibilities in some coastal regions.

These several days of expected high-pressure-influenced weather will, however, be somewhat short-lived as the majorly stormy and even wintry weather will start to return in some parts of the north or far north and possibly by next weekend and Halloween, and before intensifying further nearer the time for a major wintry/stormy blast (named storm possibility is high) with snow possibilities AWAY from the far north and higher ground for in and around 3rd - 6th November and also as covered in July 2nd report that also identified the two recent named storms in addition to this next one.

<https://www.facebook.com/share/p/1L9KUSjvi6/>

<https://www.facebook.com/share/p/1C3mw94KVM/>

Importantly, to conclude for now, the latest and current GFS and ECM computer model runs are also presently portraying quite an extended period of high pressure across our shores from midweek with some increasingly cold nights well into November and actually beyond our stormy and wintry blast expectation dates for early November, and for which will be more likely to change and revert to something similar to yesterdays GFS output and our own expectations for around these specific dates in early November.

That brings us up to date for now and this could be my last post for a good several days due to ongoing health and medical commitments in this next period . . .

Kind regards and take care,
