On-Cue High Pressure Expectations To Bring **Warm Days Widely For October** + Fog & Cool Nights + Atlantic-Driven & Stormy Later Or Not? . . .

On-Cue High Pressure Expectations To Bring Warm Days Widely For October + Fog & Cool Nights + Atlantic-Driven & Stormy Later Or Not? . . .

The upcoming week will see a greatly improved and largely received and settled spell of weather with ample and warm sunny conditions due to the expected high pressure expectations on our part and as covered in all our more recent short-to moderate to even long-range weather forecasts for this same period and within the provided weekly weather update via our website from 8 days earlier in the below.

<https://img1.wsimg.com/blobby/go/5d950f10-5c38-4949-984d-6dd3efe5e537/SEPT25.pdf>

This will also bring warm daytime temperatures for much of the working week and October quite widely, ranging in the low to mid 20s in the south and in at least the high teens further north (the October average is only 13°C) and away from something potentially less high pressure dominated and briefly different for around Wednesday only (possibly showery and/or breezy in places further north).

Additionally, as we also covered in all our earlier reports for this same period, we could very well see the inducement of some fog and colder feeling conditions overnight and

during the mornings from these optimum high pressure expectations for this on our part during the upcoming week.

Unfortunately, from in and around next weekend and Saturday 10th October, it is likely to see low pressure from the Atlantic influencing more unsettled, changeable and even windy conditions from across the north or 'very far' north of the country and possibly further afield with more changeable and cooler weather conditions for elsewhere in this period.

However, the more favourable output at present is looking and also liking for further high pressure dominance beyond next weekend and during the week starting 12th October . . .

Additionally, this will be prior to our own expectations for a more Atlantic-driven and stormy weather pattern establishing itself across our shores at times from mid-October through to late October (moderate to high possibility of multiple named storms in this developing period and also refer to your several months ahead seasonal reports for exact dates of expectation).

The full short-to-moderate to long-range weather forecasts for the week ahead and into the rest of October on our part have also been available since significantly earlier with relevant weather maps via the members login area at [Exactaweather.com](https://exactaweather.com) confirming all these details further.
