

Cold & Snow In November For The FOURTH Successive Year On Our Part & For Exactly When . . .

The atmosphere and stories have started to stir about the possibility of some meaningful cold and even snow to much lower levels including the south in November . . . Additionally, below is our highly accurate Autumn 2026 member's forecast (see images 1–3 in comments section below) for September and October themselves and depicting the exact timings of several major and expected weather events and the overall trends for those months on our part, and it is also digitally-dated 2nd July 2026.

The November part of the same forecast from July 2nd also clearly and correctly depicts a certain weather pattern unfolding during early November once the stormy weather had "passed" during late October and also leading to cold nights and frosts during this same period (HIGH PRESSURE).

It additionally goes on to cover further storm possibilities for these certain dates in November and coincide with these colder conditions before milder weather afterwards and prior to turning "considerably colder" with wintry blasts on a potentially "widespread scale" later in the month and to begin December and to kick off the official start to the meteorological winter of 2026/27.

More to follow on this in future updates and via our website/members area . . .

Kind regards to everyone and take care,
