

November Update + Now Staying Largely Settled For A Prolonged Period & NO Third Named Storm + Still Colder/Wintry Later & When . . .

The upcoming week will now see high pressure extending and dominating from our late October and early November long-range high pressure expectations and also wiping out any earlier named storm or third named storm or wintry blast expectations on our part for around November 3–6 (2 out of 3 named storms ain't too bad on our part and not many saw this next upcoming period of high pressure in any kind of form) but with continuing cold nights/first real frosts in places and forming fog patches along with a mixture of sunshine and cloudiness for many during the days.

Additionally, some hit-and-miss showers could also be induced in parts of the far north and south from around midweek.

For in and around November 11–13, it could signal the first of some changes to cooler and more unsettled conditions and wintry weather starting across higher elevations in the north and before intensifying around mid-month for many other parts and also prior to becoming considerably colder and even wintry to lower levels for many during late November and to start the meteorological winter proper for this year.
