A largely Mixed & Varied Week Beyond Monday + Further High Pressure & Temperature Rises Later...

Firstly, temperatures have hit and also exceeded the 24°C mark yesterday and today (Saturday 12th September) in the warmest parts of the country, which is a good several degrees above the September average of just 17°C (would rather forecast it repeatedly over several weeks than literally miss it altogether and keep saying NO warm/hot temperatures were incoming for this period).

It also correctly covered cloud cover inducement and less showery possibilities than forecast from elsewhere and further north for the present period and this weekend.

Additionally, temperatures are likely to rise further and higher than this during Sunday and Monday (high 20s at least) and are still within our exact date-ranges for this to occur between September 12–16.

They were also, prior to those changes from the north to incoming thundery and even blustery showers spreading southwards during late Monday and early Tuesday from a coinciding front that could also bring further heavy showers in northern and western areas in the days to follow, but also with quite mixed and varied weather conditions for most with some sunny spells and particularly more so at times the further south you are.

However, and despite this run of cooler and unsettled several days from this same period (also covered in all previous updates as a strong option and why we split these heat events several weeks earlier), the outlook is still strong and looking excellent for another period of more extensive high pressure for this one and also for even WARMER temperature rises from late next week and into early the week after and also for our SECOND repeatedly repeated dates of around September 19-25.

The third-party model projections also show a strong trend within every GFS run for today at present and the two latest ECM runs are still warm/hot at times in this same period but also a little behind the GFS in their only long-range run for today (likely to change in future runs).

Happy Saturday evening all,

James Madden, Exacta Weather
