

Screed Sled

A better way to bump cut

SCREED SLED

Part Number: SCREED_SLED

MADE IN NORTH AMERICA – MANUFACTURED BY PLATE2000

GENERAL DESCRIPTION :

PATENT PENDING INNOVATION.

The Screed Sled is a concrete construction implement designed to be pulled behind a ride-on power trowel for the purpose of bump cutting concrete slabs. It consists of a main frame and end caps which allow for standard screed boards/beams to be utilized. It can be used with 6-, 8-, 10-, and 12-foot ride-on trowel machines.

The only variance required is the length of Straight Edges installed and used in the Screed Sled.

Incorporating the Screed Sled into a contractor's process can increase FF (Floor Flatness) numbers by 10 to 20 points or more!

It is specifically designed for large, wide floor placements and is not intended for small, segmented pours or areas with numerous obstructions such as pipes, columns, or electrical cutouts.

MATERIALS :

- Made from North American High-Grade steel.
- Structure painted in Yellow.
- Includes two steel turnbuckles for attachment behind a ride-on power trowel.

FEATURES :

- Holes are designed and cut into the Screed Sled frame to add weight using cut to size rebar.
- Aluminum or Magnesium Straight edges sold separately.

COMPATIBLE EQUIPMENT :

- Pulling machine: Must be used with pan-style ride-on power trowel only. Recommended: 8-10ft hydro machines.
- Accommodates straightedges 8-12ft in length, 1-2in wide. Recommended straightedge: 2in x 4in x 10ft

RECOMMENDATIONS :

- Use true 2x4 or 2x5 straightedges that are 2' longer than the trowel being used to pull the Screed Sled. This allows for a 1' overlap on either side of the trowel as it pulls the Screed Sled.
