Rapid Transit Rescue For Toronto

Photo from Canadian Dimension, Article by Nick Grover

Every day, close to 1.4 million vehicles use Highway 401 in the core of the Greater Toronto Area, from Mississauga to Pickering. The flow of cars and trucks is slowing down in ever-longer peak periods, and thousands of people get caught in the massive gridlock on Highway 401 between Dixie Road in Mississauga and Highway 400. It's brutal and hellish, not only for the average commuter, but also for enormous numbers of trucks. Even now during peak periods, there is barely room for more traffic, particularly on either side of the Mississauga border with Toronto.

Population has been forecasted to increase over the next thirty years – close to a million more people in Toronto alone. Various reports suggest that traffic congestion in the Toronto region costs billions of dollars every in lost productivity. The Canadian Centre for Economic Analysis has estimated that congestion in the Greater Toronto and Hamilton Area costs \$44.7 billion per year. Highway 401 in Toronto will become gridlocked and nonfunctional for much of every day. That must not happen.

Many of the daily commuters who are slogging through it dream for another way to get to where they want to go. It now costs them \$11,000 and more per year to buy and operate a used car, and \$16,000 and more per year for a new car. It's essentially a massive hidden road toll that cuts deeply into the budgets of moderately incomod households, preventing them from investing in other household priorities. Personal relationships are affected, too. Family gatherings, softball games, special events and much more are falling victim to the city's gridlock – people just can't get from here to there in reasonable time.

The Ontario government is rushing to expand rapid transit systems in the Toronto region to try to keep things moving. The Finch West LRT and Eglinton LRT have become operational, and other projects – the Ontario Line, northward extensions of the Line 1 and Line 2 subways, and more GO Transit – are underway. Beyond 2030, nine more rail rapid transit expansions and bus rapid transit are planned for Toronto.

Is keeping pace with population growth good enough? Few people will be happy if all that can be said in 2055 will be "Well, at least it hasn't gotten much worse than 30 years ago". That would mean unending road congestion.

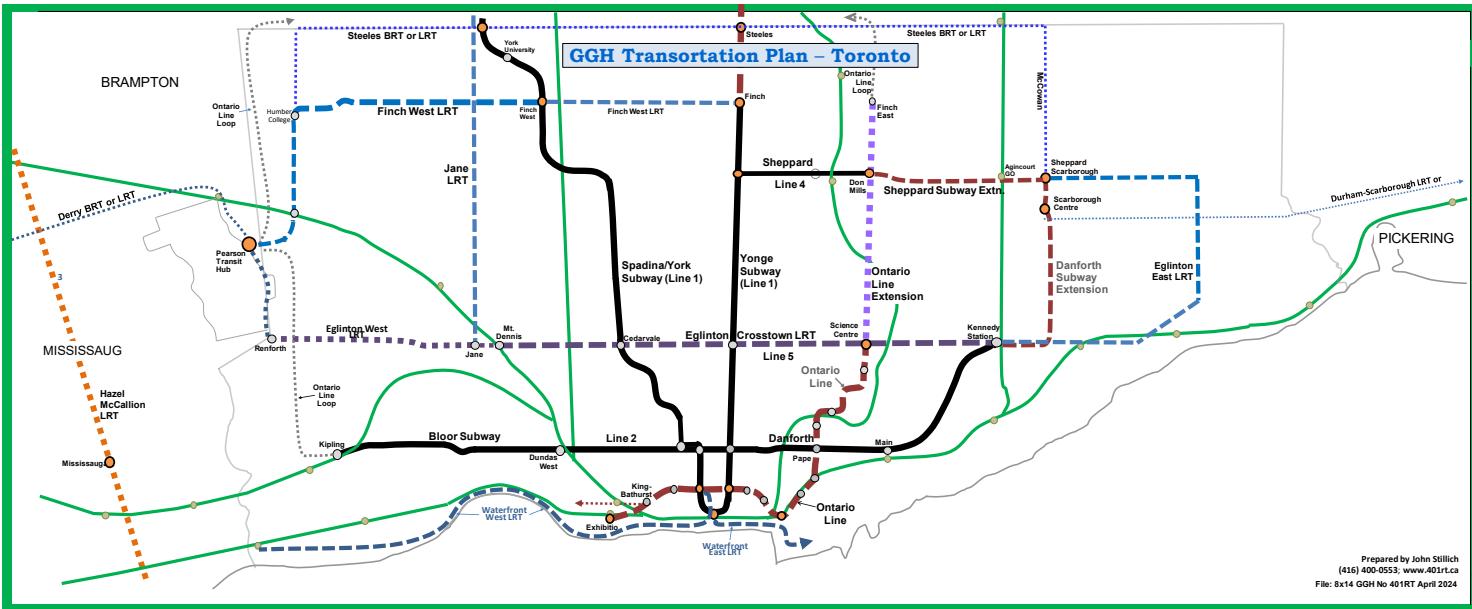

Unfortunately, with the exception of GO Transit enhancements, none of the planned initiatives will have a measurable effect on Highway 401 congestion. No rapid transit is planned that can enable rapid travel across the whole of the rapid transit-poor northern half of the city that can connect travelers directly to key destinations and to north-south rapid transit. It is why people drive into the downtown core, clogging the Don Valley Parkway and other arteries across the whole of Toronto and beyond.

The Ontario government assumes that the majority of trips taken in the core of the Toronto area continue to be by personal automobile and, for that reason and to ensure uncongested travel for trucks and commercial vehicles, the GGH Transportation Plan includes a stated policy to add road capacity to Highway 401, by means of a new underground highway 401 tunnel. The new highway is currently undergoing a feasibility study that will determine what type, size, features, locations, physical constraints, cost and risks could work, if at all. Inclusion of a rapid transit line is also included in the study. The new highway may extend from the City of Brampton to the City of Markham via the Highway 401 corridor.

The Highway 401 Tunnel plan will not work. It would require massive property acquisitions for on and off ramps and may cost \$1.5 billion per kilometre to build – possibly \$90 billion or more to construct, depending on length. Multi-year disruptions on Highway 401 would be created during decades of construction, including massive removals of earth.

By encouraging people to travel by automobile, It may be that by the time the tunneled highway is complete, it will be filled. A major side effect will be that the number of motor vehicle trips on municipal roads going to and from the highway will have increased, to up to 40% by 2055. Many municipal roads are congested during peak periods even in 2025, and cannot be widened to accommodate more vehicles.

Parking lots across the city will remain full. The downtown core will continue to be congested with cars from Toronto's northern suburbs. Pearson International Airport's expanded parking lots and garages will be full. The Don Valley Parkway and other roads will remain clogged for most of the day, even with the Ontario Line nearby. And too many households will have to bear the burdensome costs of owning and operating personal automobiles, often one for every adult in the home.

The potential end of the Canada-US-Mexico trade agreement would mean major job losses and economic redirections in Canada. Without CUSMA, both the U.S. and Canada would levy tariffs on products entering their countries. Costs to consumers will increase and job losses will be heavy, until new economic strategies take effect. The protectionist administration of the federal government in the United States may end soon after 2028; however, until it happens unemployment will surge.

Effects of Artificial Intelligence on Travel

The impacts of AI and the trade war with the United States will change forecasts for the need for the Highway 401 tunnel and for rapid transit.

The employment effects of a rapid adoption of artificial intelligence by commerce is unknown; estimates of AI-induced job losses vary widely – forecasts of job losses range from a third of existing jobs to 90% or more. The degree to which Ontario and Canada can replace lost jobs is unknown. It is likely that AI-caused job losses will be more permanent than the current trade war.

AI will affect the degree that the proposed Highway 401 tunnel will be necessary. People who are unemployed travel less – perhaps half as many trips per week – and more of their daily trips are likely to be closer to home. However, a portion of the unemployed will continue to use regional highways for access to education, or to investigate job opportunities, maintain social contacts, access health services, attend sports, music and other cultural events, and for other reasons.

The illustration below shows one scenario of what AI may mean for congestion on Highway 401 from Derry Road in Mississauga to Liverpool Road in Pickering. It assumes 4,000,000 Toronto residents by 2055, and that AI will result in a net loss of 50% of office jobs, 20% of non-office jobs and 20% of commercial vehicle jobs. In that scenario, the result is that 2055 traffic volumes will remain close to 2024 volumes. The 50%/20%/20% job loss scenario may be a middle-ground scenario. If AI-generated job losses are higher, traffic on Highway 401 will lessen; if job losses are less, traffic on Highway 401 will increase. For example, using the same population and a 25%/10%/10% net job loss scenario, Highway 401 traffic would increase by approximately 20% by 2055.

Overall, the effects of AI suggest that the Highway 401 tunnel may not be worth the effort. Even a 20% increase in vehicle volumes on Highway 401 by 2055 may be manageable with road tolls, systems of

express buses, encouraging returns to remote work, reducing the work week to four days, and, if necessary, adding 'trucks-only' lanes (perhaps above Highway 401 rather than underground).

Overall, the idea of adding more road traffic in a fixed urban area is questionable, given that congestion is already a problem. Few residents, businesses and traffic officials consider that keeping road congestion at 2024 levels is acceptable.

Effect of A.I. Job Losses on Hwy. 401 Traffic Volumes: A Scenario	Non-Commercial						Commercial	TOTALS (DAILY TRIPS)		
	Office			Non-Office						
	Peak Hrs	Off-Peak Hrs	24 hrs.	Peak Hrs	Off-Peak Hrs	24 hrs.				
Percent of daily volumes	56%	44%	100%	56%	44%	100%	19%			
AADT for Highway 401 adjusted to 2024	313,416	241,584	555,000	313,416	241,584	555,000	260,400	1,370,400		
Increase to 4.0 million	1.29	1.29	1.29	1.29	1.29	1.29	1.29	1.29		
Pre-AI increase 2055 volumes	404,408	311,721	716,129	404,408	311,721	716,129	336,000	1,768,258		
Assuming net % AI job losses of	50%	50%	50%	20%	20%	20%	20%	20%		
Job loss percentages are highly variable and conceptual only, and assume that job losses will be partially offset by new employment (unresearched). New employment is likely to be technology industry work, or personal, health, recreational, environmental, public security and other non-AI related jobs.										
Remaining travelers	202,204	155,861	358,065	323,526	249,377	572,903	268,800	1,199,768		
Trips by persons having lost jobs @ 10%	20,220	15,586	35,806	8,088	6,234	14,323	6,720	56,849		
Assumes that these will be non-work Highway 401 trips, such as for educational, medical, social, job search, or for other reasons.										
Spatial adjustment - trucks @ 1.5	222,424	171,447	393,871	331,614	255,611	587,226	275,520	1,256,617		
The average truck takes up approx. 1.5 times the space of automobiles. This affects efforts to contain overall traffic congestion.							137,760	137,760		
GO Enhancement Effect @ 2%	(4,448)	(3,429)	(7,877)	(6,632)	(5,112)	(11,745)		(19,622)		
GO Transit takes a minor share of all trips in the Toronto area, but has a disproportionately positive effect on road congestion because most of its users are longer distance.										
Incr/(Decr) in Spatial Volumes Over 2024	217,976	168,018	385,994	324,982	250,499	575,481	413,280	1,374,755

This is the increase (decrease) in Highway 401 traffic to be managed, based on the inputs entered.										
								0.3%		

The Northern Toronto Rapid Transit Gap

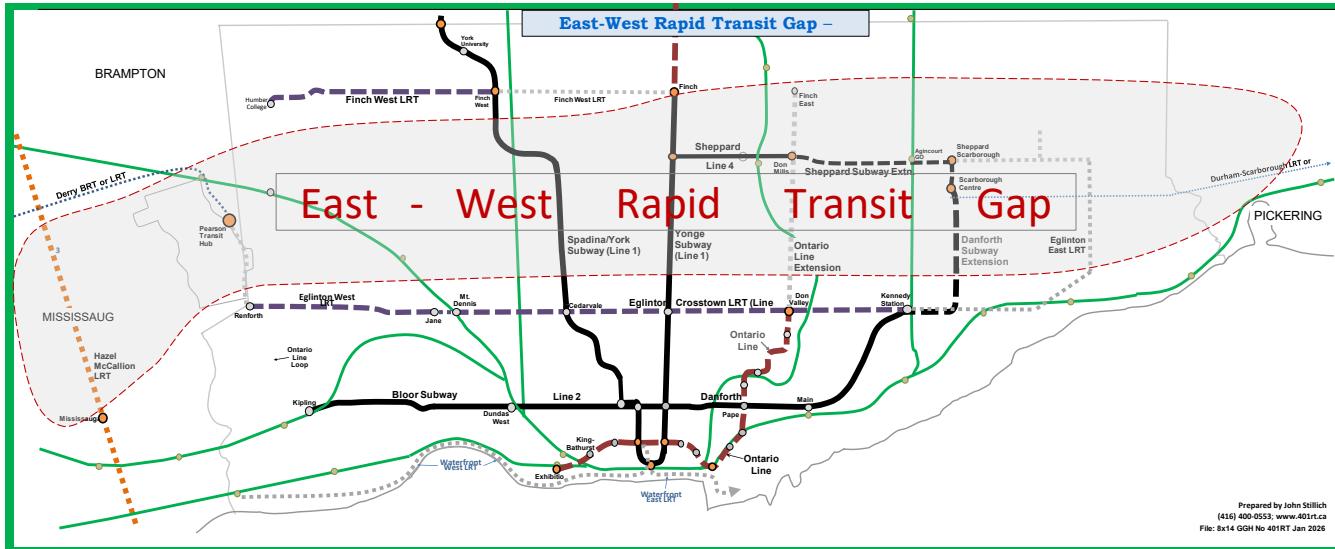

Keeping the number of trips by automobiles in Toronto to 2024 volumes requires major improvements to public transit. One essential element is a rapid transit line that can compete directly and effectively with Highway 401 through the core of the Toronto area. The affordability and characteristics of such a transit line will be affected by the net job loss impacts of AI. A description of these impacts will be described following a full description of the 401RT Express concept.

The singular factor that restrains the use by transit in Toronto and its neighbours is that the network provides no easy way to cross the northern half of Toronto, and inadequate east-west connectivity to the Line 1 subway and other north-south transit services.

One of the only two east-west rapid transit lines that exist north of Eglinton Avenue in Toronto is the Finch West LRT, which will continue to be too slow and too remote to make a noticeable difference in Toronto's traffic volumes even if extended to Yonge Street and to Pearson International Airport. The other east-west rapid transit line is the 5.5-kilometre long Sheppard Subway. Even if the Sheppard subway's planned extension to McCowan Road (at Scarborough Town Centre) is built, the subway will be only 13 kilometres long. Toronto is 40 kilometres wide. It will not attract the number of new transit trips to make it worthwhile. The key point is that these two transit lines cannot seamlessly serve people whose trip origins or destinations are beyond their terminuses.

As an example of inadequate transit, getting from Neilson Road at Ellesmere Road in Scarborough to Pearson International Airport by public transit will continue to be a struggle. It would mean a bus trip to Sheppard Avenue, a wait, another bus to the Sheppard subway at McCowan Road, another wait, the subway ride to Yonge Street, a wait for the Yonge subway, a ride to Finch Station, a wait for the Finch West LRT, and a trip on the Finch West LRT past Humber College to the airport. Altogether, almost a two-hour trip. The Eglinton LRT, geographically in the southern half of Toronto, won't be of much help.

The only sensible way to travel will seem to be to drive to Pearson on Highways 401 and 409; however, the 401 will also be congested for most of the day, and be gridlocked during peak periods.

Constructing new rapid transit lines takes up to ten or more years to complete. In the interim, short term solutions can be introduced that will help municipalities expand their transit services to attract more transit users. This can be a \$2 billion (or more) Provincial program that provides capital grants for the purchase of municipal buses and for local transit infrastructure. It also means bringing back the long-lost 50% provincial subsidy for all municipal transit operating deficits. Those initiatives will invigorate transit services and transit use by travelers. They will enable more frequent bus services, new express bus services, new community bus services and industrial shuttles, experimental autonomous vehicle services, transit shelters at all stops, and more. In various ways, that will encourage transit ridership that reduces motor vehicle traffic on local roads, including the congestion caused by cars coming off Highway 401 and other highways. The measures will reduce congestion that builds pressures to add road capacities.

Closing the Rapid Transit Gap: The 401RT Express

As the population of the Toronto area continues to increase, and in the absence of significant AI-induced unemployment (AI discussion on page 9), the most effective relief for Highway 401 congestion and gridlock is a seamless intermunicipal rapid transit line that extends from Pickering through the northern half of Toronto and deep into Mississauga – a transit line that is fast and comfortable enough to compete directly with driving across Toronto on Highway 401, includes 34 stations stops along its route, and provides easy connections to both legs of the Line 1 subway, an Ontario Line that's extended north of Eglinton East, the Line 2 Subway extension to Scarborough Centre, six GO Transit rail lines, and to myriad other destinations and a hundred bus connections along the way.

Rather than tunneling this “**401RT Express**”, the most cost-effective alignment would be one that is elevated above and adjacent to Highway 401’s eastbound collector lanes from Liverpool Road in Pickering to Highway 401 at Derry Road in Mississauga, where it is close to Brampton.

However, the alignment along the 401 bypasses several highly significant destinations, including Pearson International Airport and its massive adjacent employment areas, and downtown Mississauga.

That can be resolved. Westward from its Islington/401 station, the 401RT Express is envisaged to include a seamless 21-kilometre 16-station branch line off the Highway 401 corridor alignment, from Islington Avenue to Pearson International Airport and its employment area, and southward from there to a junction

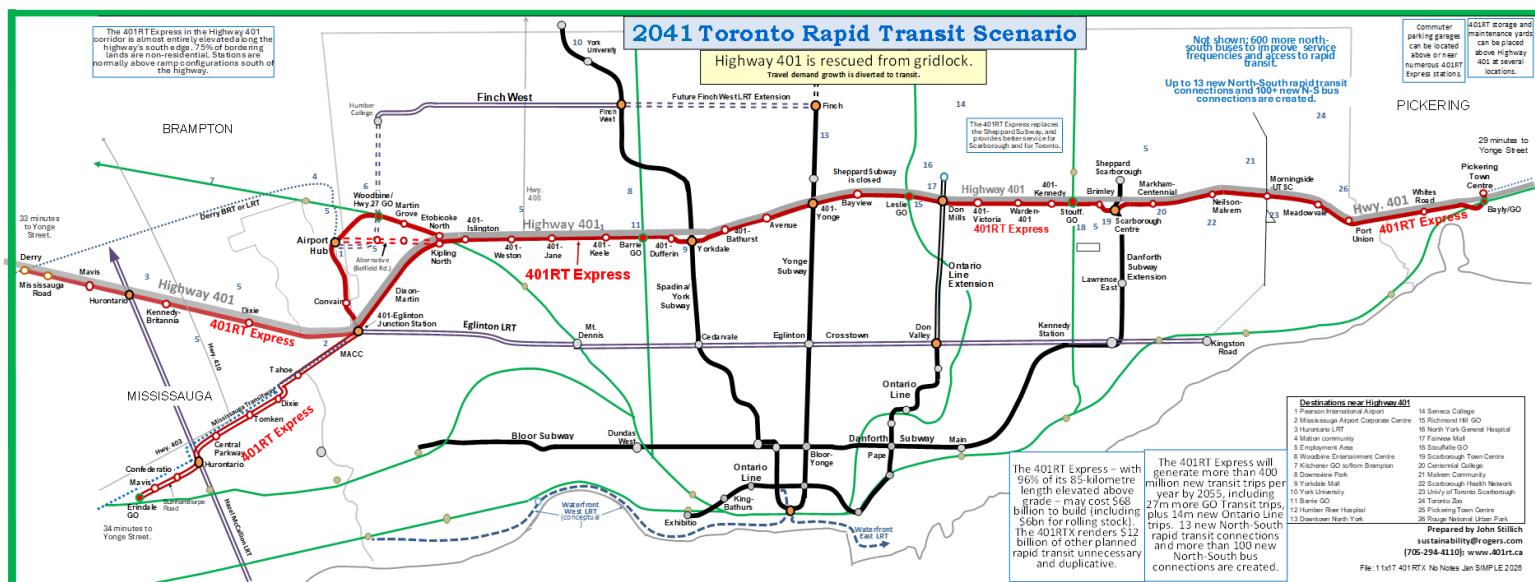

of Highway 401, Eglinton Avenue, the Eglinton West LRT, and the Mississauga Transitway. From there it would continue above existing transportation corridors to Mississauga's downtown core, and terminate at the Erindale GO Station. 401RT users traveling westward from anywhere east of Islington Avenue can choose to board a train that continues along Highway 401 to Derry Road, or to board a train that travels to Pearson and to Mississauga's downtown core. No transfers would be needed. Overall, the 401RT Express

extends for 85 kilometres, plus five kilometres to several storage and maintenance yards. Of the 85 kilometers, only 3.3 kilometres are underground – at Pearson airport and at Yorkdale.

A summary illustration is shown below. More detailed illustrations of the 401RT Express alignments (using Google Earth) can be accessed at www.401rt.ca.

Locating the 401RT Express (or just 401RT) above existing corridors means that property acquisition costs or neighbourhood disruptions would be minimal. 75% of the lands bordering the highway are non-residential. Careful separation of the 401RT from the closest bordering residential lands should minimize or resolve NIMBY (Not-In-My-Backyard) reactions. Most stations would be of basic design above the on- and off-ramps along the highway's south edge.

Elevating the 401RT also means it can be built faster than tunneling it, and at less per-kilometre cost than the Ontario government's proposed Highway 401 tunnel. Most rail bed segments would be supported by dual pillars. The length of the 401RT Express will require numerous emergency bypass tracks between stations. As an option, a continuous end-to-end third track can be built to minimize situations that interrupt services.

Commuter parking for the 401RT would be possible at numerous locations. At Erindale GO Station and at the Pickering Town Centre stations existing ground-level lots can be replaced by with new multi-level garages. Elevated parking garages can be constructed at several 401RT Express stations, and are possible at the base of Highways 410, 400 and 404 to enable commuters from north of Toronto to transfer to and from the 401RT. Maintenance yards can be constructed over Highway 401 east of Jane Street, east of Dixie Road, and at Kennedy Road in Scarborough, above Eastgate Parkway, and potentially at other locations. At Pickering Town Centre, some land would need to be acquired from retailers.

Operating speeds can entice many people out of their cars and onto transit. For example, the 401RT will get travelers from its Yonge Street station to Pearson International Airport in about 26 minutes. End-to-end travel time from Pickering to Erindale GO station in Mississauga could be 63 minutes. These times reflect an average 85 kilometre per hour cruising speed between stations.

Travel time for the arduous trip example between Neilson Road and Pearson airport would be cut in half, from 110 minutes to just 52 minutes. That kind of change would have a transformative effect – Scarborough and Etobicoke would be reachable and feel closer together, particularly for some of the 20% of adult residents who cannot or do not drive automobiles.

With a 401RT Express operational, many travelers flying out of Pearson International Airport will be able to leave their cars at home instead of fighting traffic and paying for airport parking. Friends and families won't need to drive them to or from the airport.

Importantly, the 401RT Express would have enough capacity to offset all non-commercial traffic growth on Highway 401 for many decades after it becomes operational. The perceived need to add road capacity to any part of Highway 401 would end.

401RT Express Ridership

It is sometimes said that high-capacity rapid transit doesn't work in the suburbs because urban densities are too low. But GO Transit's Lakeshore Line shows that it can. It works because it brings commuters from suburban locations directly into Toronto's downtown core. In comparison, the 401RT has key destinations across all of its route, the most noteworthy being Pearson International Airport and its adjacent employment zone, and the Line 1 subway. As with GO Rail Transit, most 401RT users arrive at stations by bus or by car (where parking exists). The success of the 401RTX would also stem from the fact that, for many longer-distance travelers, the only two practical travel options would be Highway 401 or the 401RT, and if the highway is too often congested or affected by motor vehicle crashes, the 401RT may be considered the best and most reliable option.

Effects of artificial intelligence and a (hopefully) temporary trade war aside, the 401RT Express will entice enough new ridership to ensure its success. These include its

- High average cruising speed between stations (85 kph),
- Continuous length and comfortable ride,
- High visibility above grade,
- Central location in the core of the Toronto Area,
- Population growth (million more Torontonians in thirty years),
- Congestion and gridlock on roads and highways,
- Smart urban development,
- The increasingly unaffordable cost of personal automobiles and other costs of living,
- Intensified/improved bus services on intersecting arterial roads and on neighbourhood roads,

- 401RT Express connections to GO Transit that create long-desired east-west rapid transit services to and from the radial GO system,
- Much easier access to Pearson and its adjacent employment areas, from across Toronto and from Mississauga, and
- Latent transit demand for rapid transit from current car users and from many of the 20% of Toronto adult residents who do not have a driver's license.

Latent demand for an alternative to driving is important, yet has not been researched; however, it is likely that a sizable portion of today's Highway 401 users would prefer to use a viable rapid transit alternative. The 1.3 million trips per day on Highway 401 in 2019 is estimated to rise to approximately 1.8 million by 2055. Assuming that current/recent forecasts remain valid, major shifts from driving to the 401RT Express will occur because travel on Highway 401 and on alternative local roads may often be slower than traveling on the 401RT for the east-west segment of most trips. In effect, commuters will have little or no choice but to use the 401RT if they need to travel. The carrying capacity of roads and highways may be increased to various degree with the advancement of autonomous vehicles.

There is a risk that the newly-opened Eglinton LRT will be at overcapacity if it is highly popular or if a significant amount of high density urban development occurs over the next few decades. It may be that the 401RT Express, in addition to absorbing travel demand growth from Highway 401, will be needed as a relief valve for the Eglinton LRT, perhaps even in the shorter term.

Numerous other transit ridership effects arising from the 401RT Express are anticipated to occur by 2055:

- GO Transit's six intersects with the 401RT will generate approximately 27 million new GO Transit trips and 24 million new 401RT Express trips.
- The Islington-to-Pearson-to-Erindale GO branch of the 401RT will generate additional trips to and from downtown Mississauga, the Mississauga Airport Corporate Centre, and other points, including from east of Islington Avenue;
- The transit modal share of trips to and from Pearson International Airport and its adjacent employment area will be much higher than exists today;
- Additional buses on north-south routes intersecting with the 401RT will attract new transit users whose destinations are not the 401RT; an estimate is 52 million new trips / year by 2051;
- Some urban development in the form of high density housing and office uses at and near the 401RT will have a higher than average transit modal share;
- High costs of automobile ownership and use, and other economic effects, will accelerate the shift of trips to the 401RT.
- The growth in truck movements will contribute to the shift to transit for commuters.

Without the 401RT Express or a similar rapid transit line, those additional transit trips will not occur. Overall, the 401RT is estimated to generate more than 400 million new transit trips per year by 2055 (more than one million trips per day), excluding net job loss effects of artificial intelligence. Together with other planned transit initiatives, the shifts to transit can offset all travel demand growth for use of Highway 401. An equilibrium of use between Highway 401 and the 401RT would be set that keeps traffic on the 401 moving. The 401RT should reduce dramatically the high levels of congestion on the 401 between west of Dixie Road and Highway 400.

Key destinations directly served by the 401RT would be Pickering Town Centre, Scarborough City Centre, the Line 1 subway and the Ontario Line, Yorkdale Mall, Pearson International Airport and its adjacent

employment areas, and the Mississauga City Centre area. Private shuttle buses operated by groups of employers can deliver employees to and from locations not served by municipal bus routes.

Overall, the 401RT will attract ridership from a wide swath of geography, from north of Lawrence Avenue to Steeles Avenue, and from numerous points of origin in Pickering and Mississauga. While 400 million new transit trips per year by 2051 is a seemingly high volume of new transit trips, it is less than the boardings per station forecasted by Metrolinx for the Ontario Line from Exhibition GO to Eglinton Avenue East; however, because most 401RTX trips are likely to be longer, occupancies per train kilometre would be higher.

An extension of the Ontario Line from Eglinton Avenue East to the 401RT Express will be necessary to keep 401RT Express users from overcrowding the Yonge Street subway. A northerly extension of the Ontario Line from Eglinton Avenue East to north of Highway 401 is already included in the GGH Transportation Plan.

For some, the 401RT Express seems too big an endeavour – 85 new kilometres of rapid transit, with up to 50 new stations and 13 new rapid transit connections. But it has to be done – it is critically important if the functionality of Highway 401 is to be maintained and the growth of transit ridership is not to stagnate. And in reality, it's not a significantly larger project than the sum of rapid transit expansion projects currently underway for Toronto and Mississauga. The critical point is that the 401RT Express is adequate to the scale of the transportation crisis facing Toronto, and necessary if the Premier of Ontario's ill-conceived highway tunnel is to be avoided.

Effects of AI on 401RT Express Ridership

Excluding the unknown effects of artificial intelligence on employment and the affordability of and need to travel, the 401RT Express, if fully implemented, would generate well over 400 million new transit trips in the Toronto area.

The example of an AI impact scenario for Highway 401 can also be extended to provide a sense of what AI would mean for trips on the proposed 401RT Express. The illustration below is based on an assumption that the Highway 401 tunnel will not be built. It illustrates the effects on the 401RT Express in the Highway 401 corridor plus its seamless branch from the Islington/401RT station to Pearson International Airport, and from there southward to Eglinton Avenue and through downtown Mississauga to Erindale GO station.

The scenario assumes that ongoing road congestion will result in travel demand growth being diverted to transit – specifically to the 401RT Express. Based on a net AI job loss scenario of 50% for office jobs, 20% for non-office jobs and 20% for transport jobs, the scenario indicates that transit ridership will potentially be 170 million new 401RT trips per year in 2055, plus 21 million new trips on GO Transit and 40 million on enhanced bus services. The operating revenue to cost ratio for the TTC would be (roughly) 57%, based on an average fare of \$3.75 for a 401RT Express trip, \$3.50 for a bus trip, and operating costs of roughly \$1.360 billion per year. The 2025 TTC operating ratio was 46%. (N.B. Operating revenues and cost would be distributed to Mississauga, Toronto and Durham transit systems, and assumes that costs and revenues are proportionately similar.)

If net AI-generated job losses are higher, traffic on Highway 401 will decrease, travel by automobile will be faster than it is today, and shifts to transit will be less. If job losses are less, traffic on Highway 401 will increase and demand for transit alternatives to driving will increase. For example, using the same 4,000,000 population and a 25%/10%/10% net job-loss scenario, Highway 401 traffic would increase by approximately 20% by 2055. If the traffic increase is diverted to the 401RT Express, transit ridership increases dramatically to close to 220 million per year, including 25 million on GO Transit and 48 million on

enhanced bus services. The 401RT Express operating revenue-to-cost ratio for the TTC would be much higher than the TTC average in 2025. (A template to enable various scenarios to be run is available as a downloadable file at www.401rt.ca.)

Due to uncertainties, what the AI impact be by 2055 and beyond is unknown. Perhaps the question is the degree to which the 401RT Express will convey benefits, for purposes of affordability for travelers, promoting employment (including 40,000 per year of construction), long term environmental benefits, the need to avoid a Highway 401 tunnel, or for other reasons. If traffic on Highway 401 decreases as a result of AI, or remains at current or modestly higher levels, there is no need to construct the Highway 401 tunnel.

Estimated Potential Demand for a 401RT Express (Including AI Job Loss effects)	Non-Commercial Vehicles (Daily)						Commercial Vehicles	TOTALS (Daily)		
	Office			Non-Office						
	Peak Hrs	Off-Peak Hrs	24 hrs.	Peak Hrs	Off-Peak Hrs	24 hrs.

Trip diversions to 401RTX caused by increases in trucking							202,842	202,842		
Increases in space taken up by trucks will add to congestion and to diversions from driving by automobile to using the 401RT Express.										
Potential 401RT Express ridership in 2055 10%	27,126	20,909	48,036	24,785	19,104	43,889	202,842	294,766		
The Total 294,766 represents the degree to which average daily congestion increases, and the potential modal shift to transit per day that needs to be made to keep traffic to 2024 levels by 2055.							Annual 2055			
							107,675,000	295,000		
Other Factors that increase 401RT Express ridership:										
• Urban development at/near potential 401RT Express stations (higher transit modal share due to close proximity to Highway							7,490,000	20,500		
• Potential 401RT Express ridership increase from new GO Transit intersects							18,660,000	51,100		
• Higher transit share of trips to Pearson (air travelers only)							6,530,000	17,900		
• Shifts to transit – Worker commutes to Pearson and adjacent employment areas							10,460,000	28,700		
• Trip transfers from Eglinton E LRT & extended Sheppard Subway to a 401RT Express							19,650,000	53,800		
Estimated 401RT Express ridership in 2055										
Additional ridership effects of a 401RT Express:							170,465,000	467,000		
• Increase in GO Transit ridership resulting from intersects with 401RT Express							21,300,000	58,400		
• Non-401RT Express trips generated by additional buses on intersecting routes							40,430,000	110,800		
Estimated transit ridership effect of the 401RT Express							232,195,000	1,103,200		

Why The 401RT Express Should Be Built

The 401RT Express should be seen as the more effective and more appropriate alternative to the Ontario government's proposed Highway 401 tunnel: the tunnel will add to road traffic, while the 401RT Express would reduce it. If the highway tunnel is built, funding for all future rapid transit planning will be constrained or become unaffordable.

The effects of a full-scale 401RT Express would be transformative for the core of the Toronto area. It would boost the attractiveness of the Toronto area as a place to live, work, invest, and enjoy. A list of 67 general benefits is attached to the end of this document. No other rapid transit initiative or combination of rapid transit initiatives would provide as many benefits.

The 401RT Express would, at long last, seamlessly fill the rapid transit gap across the northern half of Toronto, and connect all of Toronto from east to west, and be the first to address the reality of cross-boundary travel which, for Highway 401 alone, exceeds 600,000 trips per day. By connecting to key destinations, 13 other rapid transit lines (including GO) and more than 100 bus routes, the 401RT would transform travel in Toronto away from being a car-centres regional core to being a transit city. It will create a dramatically significant positive effect on affordability for travelers and offer enormous opportunities for people who do not have a driver's license.

Building the 401RT Express would, during its construction, create 40,000 jobs per year during its construction, and likely several thousand permanent jobs thereafter. Given the threats to jobs from the trade war and the impacts of AI, this is highly important.

If the approved 1,000-kilometre Alto High Speed Rail project between Toronto and Quebec City is seen as worthwhile, the 85-kilometre 401RT Express is more so. AI impacts aside, the Alto HSR, when completed, may carry 100,000 to 200,000 trips per day, while the full-scale 401RT will carry a million per day by 2055.

The 401RT Express is justifiable for other reasons:

- Current congestion levels are unacceptable; the Province's plan to increase highway capacity will increase reliance on personal automobiles for travel, and add to congestion.
- The 401RT Express will enable freight to move more freely on Highway 401.
- Access to Pearson is problematic; the 401RT Express can end GTAA plans for more parking garages.
- The 401RT Express would rescue the Eglinton LRT if the ridership capacity of the LRT is exceeded.

The 401RT Express would be built by multiple teams working simultaneously on different aspects and locations along its 85-kilometre length. However, if there is a need to prioritize segments of the 401RT Express, the first should be the one that affects the Sheppard Subway and Eglinton East LRT, both of which are being actively planned.

Goodbye to The Sheppard Subway

Despite many years of discussion and planning about extending the Line 4 Sheppard subway to McCowan Road in Scarborough, **the 401RT Express will render the entire Sheppard Subway, including its proposed extensions, obsolete**. According to TTC statistics, people use the Sheppard subway mostly to go to Yonge Street or to catch a Don Mills bus, or to go to points east of the subway's Don Mills terminus. With a 401RT operating, most travelers who want to get to Yonge Street from, for example, somewhere along Markham Road or Kennedy Road, will prefer to take a bus not to Sheppard Avenue East but to the nearby 401RT, two minutes south of Sheppard Avenue.

Very importantly, the 401RT Express will enable seamless travel to or from west of Yonge Street and eastward to Pickering. Closing the Sheppard Subway could mean replacing it with a seamless bus service that can run from Toronto's eastern border to Weston Road. The extension of the Sheppard Subway, if extended to Scarborough Town Centre, would cost approximately \$7.5 billion to construct. Because the 401RT will render the entire Sheppard Subway operationally non-viable, the extension costs should be avoided. Lands at the current Bayview, Bessarion and Leslie stations can be repurposed for much-needed

multi-storey affordable housing – for seniors, lower-income households, currently homeless persons, and for other persons who need support.

Also under active planning is the \$4.5 billion Eglinton East LRT (EELRT), which would run eastward and northward from Kennedy Subway station. The principal impetus for the EELRT is to provide better transit service to the University of Toronto’s Scarborough campus (UTSC) and to the Malvern community. However, the 401RT Express will, together with Line 1 and Line 2, provide much easier and faster service to UTSC and Malvern from across all of Toronto. **The Eglinton East LRT should not be built.**

Building the Line 4 extensions and the Eglinton East LRT would be costly and historic mistakes. More information can be found at www.401rt.ca’s “Sheppard Extension Problem” file.

How is the 401RT Express Affordable?

The 401RT Express will cost an estimated \$62 billion to build; rolling stock (trains and buses) will cost an additional \$6 billion. People of thrift, and perhaps others, will argue “That’s Too Much!! I can’t afford this!! My taxes will go through the roof!” Not so.

The \$68 billion cost to taxpayers is deceptively overstated. Municipal taxpayers won’t be digging into their wallets to pay that much. For one thing, the cost would be carried forward by public debt; in that way, the future users of the 401RT Express would, very appropriately, contribute to the cost. Debt financing also greatly reduces the annual cost to taxpayers. Moreover, the cost will not be immediate; it will rise slowly over a decade of construction.

As a cost-saving measure (and as a land use efficiency measure), members of the development industry may be contracted to build and pay for some 401RT Express stations in exchange for air rights to build residential and/or office towers above the station area.

A significant cost-saving measure will be the elimination of some of the Ontario Government’s currently planned rapid transit initiatives, including fairly high-profile initiatives that have been around for decades and hoped for by many. Altogether, they produce a cost-avoidance of at least \$13 billion in future infrastructure costs. Several transit projects being planned that would be rendered obsolete by the 401RT Express include:

1. The proposed \$7.5 billion Sheppard Subway extension to McCowan Road and to Scarborough Centre. The subway would run closely parallel with the 401RT Express and not have the ridership volumes to justify its construction. Instead of a 13-kilometre Sheppard Subway, Toronto would have the 85-kilometre 401RT Express. The decommissioning costs of closing the Sheppard subway may cost \$800 million, after the sale of Sheppard Subway station lands. Station lands can also be repurposed for affordable housing and for supportive housing.
2. Most of the proposed \$4.5 billion Eglinton East LRT extension in Scarborough. It’s long been thought that an eastern extension from Kennedy subway station to the University of Toronto’s Scarborough campus and to the Malvern community should be a priority. However, a 401RT Express through Scarborough provides much better and faster access between the northern half of Scarborough and the rest of Toronto. However, it may be worthwhile to extend the LRT to Kingston Road (roughly \$1.7 billion), but not further.
3. The planned \$1.3 billion extension of the Eglinton West LRT from Renforth Drive to Pearson would not be needed. Travelers to Pearson would transfer from the Eglinton LRT to the 401RT at a junction station east of Renforth. The Eglinton LRT extension to Pearson would be an impediment to construction of the 401RT Express. ***It should not be built.***

Additionally, the 401RT Express and the Eglinton LRT would divert some ridership from a proposed \$2.6 billion Jane Street LRT, reducing its perceived benefits. For example, a trip from Jane at Wilson Avenue to downtown Mississauga currently takes 78 minutes; a Jane LRT wouldn't make the trip much faster. Using the 401RT, the trip would take just 33 minutes. Overall average trip lengths on Jane buses would shorten, decreasing crowding on Jane buses.

For a 401RT Express across the underserved northern half of Toronto and into Pickering and Mississauga, and 400+ million new transit trips per year by 2051, a \$68.4 billion cost for rapid transit is a huge bargain.

The cost to Ontario would very likely be reduced by federal cost-sharing as a public transit project, and may also be eligible as a "Build Canada" initiative that increases economic productivity and maintains the essential functionality of Highway 401 for the movement of workers and goods. In the past, federal cost-sharing for transit infrastructure has reached 40% of eligible costs; for the 401RT Express, this can be a \$27.4 billion federal share.

The 401RT Express appears to meet the criteria for Build Canada projects. It increases economic productivity, is environmentally appropriate, First Nations would approve the project, and it has a reasonable expectation of successful completion.

Of critical importance, the 401RT Express eliminates the perceived need to build a new highway tunnel under Highway 401, a potential cost avoidance of \$90 billion or more.

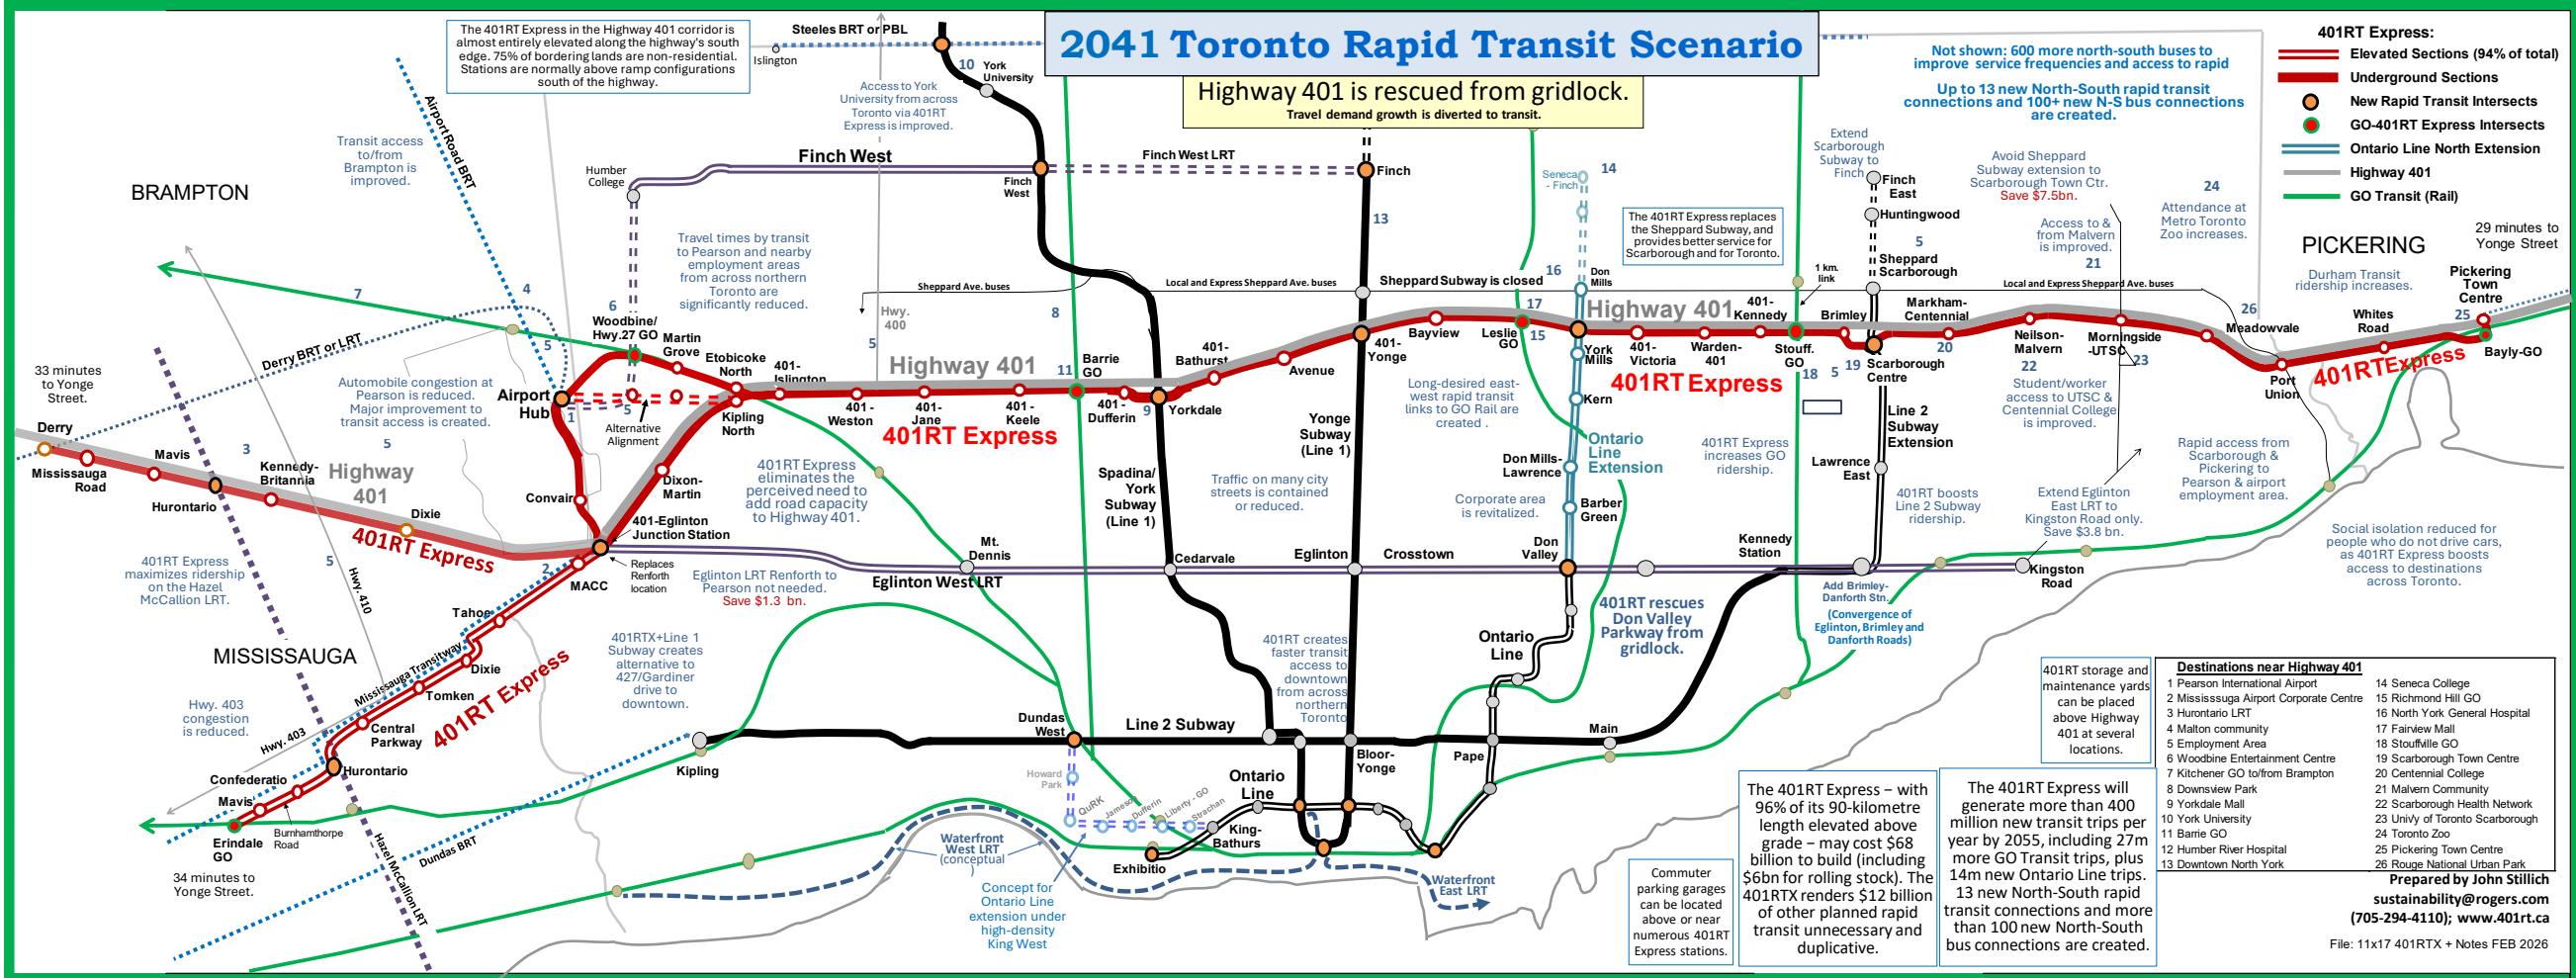

The tax cost to Toronto households would be highly affordable. Cost sharing by non-residential taxpayers and the federal government (assuming 40%), population growth, deficit funding and assuming a borrowing rate for the Ontario government of 3%, the average daily cost per taxpayer by 2041 for Ontario's costs to build the 401RT Express would grow to about **18 cents per day**. Ontarian's share of the 401RT Express's federal cost may add another **4 cents**.

And what's the comparison? The average cost per year to own and operate a new gasoline-powered car in Ontario can be, variably, \$15,000 per year. That's \$41 per day. So, in a way, switching from driving a car to using public transit can be a household budget bonanza.

All of a sudden, it's an easy decision.

401RT Express Cost Scenario - Per Taxpayer	
(Costs to build, in millions of dollars)	
<u>Canada:</u>	<u>Ontario:</u>
68,500	68,500 Gross Infra Cost of 401RT Express
27,400	27,400 Canada Share @ 40%
	41,100 Net Ontario cost
3.0%	3.0% Assumed borrowing rate 2041
822	1,233 Public debt cost per year
65.7%	64.7% Personal income tax share
539.8	797.6 millions \$\$ per year
47,700,000	19,700,000 Canada/Ontario population 2041
70%	63% population that pays income taxes
33,390,000	12,411,000 population that pays taxes
539.8	797.6 Millions \$\$ per year
\$16.17	\$ 64.26 Cost per taxpayer per year in 2041
4	18 cents per day

2041 Toronto Rapid Transit Scenario

30+ years from now, there will be a million more people living in Toronto. The **401RT Express** is essential if highways and local streets in Toronto are to be decongested. Currently-planned rapid transit expansions will struggle to keep up with travel demand growth, and will not reduce overall use of motor vehicles on city streets. Adding road capacity to Highway 401 is not a solution; its impact will be to encourage driving and to increase congestion on local roads.

The **401RT Express** should be recognized as inevitable and urgent. The 401RT Express's seamless length, speed of service, connectivity, and high visibility will make it a success. It will render numerous current rapid transit initiatives unnecessary and operationally nonviable: the Eglinton West LRT Phase 2 extension to Pearson International Airport, the Sheppard Subway extn (and the Sheppard Subway itself), most of the Eglinton East LRT, and the Jane Street LRT. Spending on these will waste close to \$12 billion.

The \$68 billion **401RT Express** (including \$6 bn rolling stock) is highly affordable, and is estimated to be three times as cost-effective as rapid transit initiatives currently being implemented, based on new transit trips generated. Federal cost sharing can be 40%. The 401RT Express (or similar) would be transformative for transportation in Toronto, and is essential for achieving climate change goals. It is essential for tens of thousands of households that struggle with the high costs of automobile ownership and use. Visit www.401rt.ca for more information. Call John Stillich at 705-294-4110 or visit www.401rt.ca for more information.

Benefits of the 401RT Express

The 401RT Express is a concept for a seamless 85-kilometre 50-station rapid transit line through the core of the Greater Toronto Area that is almost entirely elevated over or alongside existing transportation corridors. It would operate from Pickering Town Centre to an Islington station at Highway 401 in Toronto and, westerly from there, divided into two branches – one to Pearson International Airport and its employment area, and then southwesterly through Mississauga’s downtown core to the Erindale GO station, and the second branch continuing along the Highway 401 corridor to Derry Road in northwestern Mississauga.

The 401RT Express is of transformative significance, and would affect other transit expansion decisions in Toronto, Mississauga, and Durham Region. The scale of the 401RT Express reflects the magnitude of the transportation and climate change problems facing the region; the overall traffic congestion problem in Toronto cannot be resolved with constrained approaches. The following list of general benefits is lengthy and significant, and highlights the strategic importance of the 401RT Express in the Toronto area. Purely local benefits are generally not included in this list.

1. The first practical transit alternative to driving across northern Toronto is created, bringing rapid transit much closer to many thousands of today’s car-driving commuters.
2. The first seamless and practical rapid transit connection is created between Toronto and downtown areas of Mississauga and Pickering.
3. Access to the ongoing movement of employment and other destinations from the downtown Toronto core to its northern suburbs becomes less car-dependent.
4. Up to thirteen new rapid transit connections are created (Hazel McCallion LRT, Mississauga Transitway, Union-to-Pearson Express, Woodbine GO, Barrie GO, Spadina/York Subway, Yonge Street Subway, Oriole GO, Pickering GO, an extended Ontario Line, the Scarborough Line 2 subway extension, a possibly-relocated Agincourt GO station or additional GO/401RT Express transfer station south of the Agincourt GO station, and the Lakeshore East GO Transit line at Pickering).
5. Gridlock on Highway 401 is avoided as high volumes of transfers from the highway to rapid transit occur.
6. Gridlock and congestion on the Don Valley Parkway is ended as the 401RT Express enables rapid transit access to the Ontario Line .
7. Plans to widen Highway 401 between Highway 427 and Highway 404, or to construct a highway tunnel under the 401, are rendered unnecessary. The 401RT Express and Ontario Line reduce or end road congestion in downtown Toronto.
8. The 401RT Express creates a large economic stimulus as approximately **40,000** new jobs are created for up to 12 years during the 401RT Express’s construction – more than any other transportation job creation project in the GTA has achieved.
9. Hundreds of ongoing transit operating jobs are created, including maintenance, customer service, security, administration, and more.
10. More than 100 new surface bus route connections to rapid transit are created.
11. North-south bus trips to east-west rapid transit are significantly shorter in time and distance.
12. The 401RT Express enables the GO Rail system to be used for trips across Toronto’s suburban North; east-west rapid transit access to/from the radial GO Rail system has been long desired.
13. The seamless 85-kilometre length of the 401RT Express and its up to 50 stations maximize trip origin-destination opportunities.
14. The extremely high level of congestion on Highway 401 between west of Dixie Road and Highway 400 is eased or ended.
15. Truck transport is improved, and economic costs of transport delays on highway 401 are avoided as car drivers transfer to the highly visible 401RT Express.
16. The trip capacity of the Highway 401 corridor in Toronto is more than doubled.
17. The 401RT Express reduces or ends road congestion on the Don Valley Parkway, by providing east-west connectivity to the Ontario Line and Line 2 extension in Scarborough.
18. The 401RT Express relieves potential over-capacity pressures on the Eglinton LRT.
19. Traffic congestion on city streets throughout Toronto and in parts of Mississauga and Pickering is reduced as major modal shifts to transit occur; all road trips begin and end on local streets.
20. Travel times across the northern half of Toronto are significantly reduced when compared to current transit services. End-to-end travel time on the 401RT Express from Pickering Town Centre to Erindale GO station (69 kilometres) is approximately 80 minutes. This compares well to current travel times by automobile during peak periods.
21. Excluding unemployment effects of artificial intelligence and the trade war with the United States, the 401RT Express increases transit ridership by more than 400 million per year by 2051, including a 52 million annually in local non-401RT Express trips on enhanced intersecting bus services and 24 million new 401RT Express trips resulting from new GO Rail intersects.

22. GO Transit ridership increases by approximately 27 million trips per year by 2051, 25% beyond current forecasts, as a result of six new Intersect stations with the 401RT Express (Erindale GO, Kitchener Line at Highway 27, Barrie GO Line, Leslie-Oriole GO, the (potentially relocated) Agincourt GO station, and Pickering GO).
23. Overall, the “loose ends” of north-south rapid transit lines are connected to enable rapid access to destinations along the 401RT’s east-west axis. This is highly significant.
24. Overcrowding of the Yonge Subway as a result of high 401RT Express ridership is avoided once the Ontario government’s plan to extend the Ontario Line to Sheppard Avenue East is completed; this essential extension should coincide with 401RT Express implementation.
25. The 401RT Express may reduce the number of automobiles on Highway 401 and other roads by approximately 15%, a reduction that can enable some streets to have more and safer bicycle lanes, wider sidewalks, and more greenscaping.
26. The addition of large multi-level garages above the Weston and Jane 401RT Express stations (plus access ramps) may enable the creation of a transfer point for drivers having come into Toronto on Highway 400. This enables people to avoid using city streets to get to downtown Toronto or other destinations.
27. In general, access to services and to employment across Toronto and to/from Mississauga, Pickering and Brampton becomes much faster and easier, especially for persons of modest incomes, or who do not own cars or cannot drive. This is a significant enhancement of quality of life for them.
28. The northwest arm of the 401RT Express brings parts of Milton and Brampton within rapid transit commuter range of Toronto. For example, travel time on the 401RT Express from its Derry Road terminus to Pearson International Airport is approximately 25 minutes.
29. Rapid, affordable, and direct rapid transit access to Pearson International Airport from downtown and from suburban locations across the region is created (Approximately 85% of trips to the airport do not originate from downtown Toronto).
30. Travel costs are reduced for thousands of households as fewer cars need to be owned, or are used less. Money saved can be redirected towards other household priorities. After-tax household savings vary widely, but can range between \$11,000 and \$20,000 per year per vehicle (or more), less the cost of using public transit (approx. \$1,900/year in 2024). **This is a significant household affordability benefit.**
31. For many commuters, the 401RT Express becomes the first alternative to what is now an expensive forced daily drive on congested highways to and from Toronto.
32. The Greater Toronto Airports Authority’s plans for a transit hub are transformed to be much more effective, and perhaps simplified; parking infrastructure would be reduced.
33. Rapid direct access to Pearson International Airport via the 401RT Express from locations across Toronto makes the Government of Ontario’s planned \$1.4 billion extension of the Eglinton Crosstown LRT from Renforth to Pearson International Airport unnecessary. A 401RT Express northward from the juncture station at Eglinton Avenue east of Renforth Drive would provide the rapid transit link to/from Pearson. The LRT extension would be an impediment to a continuous 401RT Express service to and from Pearson; **it should not be built.**
34. Access to the employment areas surrounding Pearson airport is greatly improved; these employment areas in Mississauga and Toronto revitalize as accessibility to them improves, and helps them to become more attractive to business and to workers.
35. Current and forecasted road overcapacity situations in the large employment areas around Pearson International Airport are reduced.
36. Employment opportunities and labour market conditions are enhanced. Fewer people will decline employment opportunities near the airport or elsewhere due to road congestion and travel times. This resolves an important concern of employers regarding workforce access, especially at and near Pearson International Airport.
37. The 401RT Express’s intersect with the Line 2 subway’s extension at Scarborough City Centre significantly increases ridership on the Line 2 extension.
38. Enhanced access from across all of Toronto to the University of Toronto Scarborough Campus, Centennial College (Scarborough), York University, and the U of T downtown campus is created. Many students will no longer need to decide on courses of study based on travel time and distances to campuses, nor will need to acquire an automobile for their commutes.
39. Improved and rapid access to the University of Toronto’s Scarborough campus using the 401RT Express will reduce ridership volumes on the proposed Eglinton Crosstown East LRT extension, **rendering it unnecessary.** Savings from eliminating the LRT extension approaches \$4.6 billion. Extending the LRT from Kennedy station 4.5 kilometres to Kingston Road (\$1.7 billion) will ease travel for some transit users east of Kennedy station.
40. Overall, the 401RT Express serves Scarborough residents much better than the Sheppard Subway, **rendering the entire Sheppard Subway obsolete.**
41. The perceived need for a Jane Street LRT proposed by Toronto would become less beneficial, as east-west connections provided by the 401RT Express, the Finch West LRT, and the Eglinton Crosstown LRT at Jane attract Jane bus users and reduce passenger volumes and trip-length crowding on Jane Street buses to Bloor Street. Savings may be \$2.6 billion.
42. Access to employment opportunities and services for residents of disadvantaged communities and for people who do not drive automobiles is significantly improved.
43. Direct rapid transit access to Mississauga’s Airport Corporate Centre (at MACC station) from across northern Toronto and from central Mississauga is created.
44. Canada and Ontario government capital cost contributions could result in an influx of more than \$50 billion into the Toronto area economy during the 401RT Express’s construction. Almost all of the 401RT Express’s costs would be provincially and federally funded.

45. Overall, federal cost-sharing would make the 401RT Express a much more financially advantageous option for the Government of Ontario, compared to the proposed Highway 401 tunnel (illustration at right). Shareability would be based on improving economic productivity, environmental benefits, and social factors.

46. Economic losses from traffic congestion are reduced; business efficiency is improved.

47. Economic losses from imports of motor vehicle fuels and automobiles are reduced. Most cars and trucks sold in Ontario are imported, as is almost all fuel.

48. The number of deaths and injuries from motor vehicle collisions and the traumas and costs borne by the families and friends of crash victims are reduced, as are the associated daily congestion effects of collisions.

49. The 401RT Express helps enable the transformation of Yonge Street north of Highway 401 as the Yonge Street subway is extended to Highway 7. The 401RT Express will attract new transit users from driving on Yonge Street, by making it easier for them to access employment east and west of Yonge Street.

50. Greenhouse gas emissions are reduced by more than 800,000 metric tons per year until electricity-powered vehicles become more prominent. Toxic vehicle emissions and their negative effects on health are also reduced.

51. The operational effectiveness of the Toronto area's pre-existing transit system is improved; for example, more people will use existing buses and new buses for local trips not related to the 401RT Express (approximately 52 million per year by 2051) as service frequencies improve with the addition of more than 600 north-south buses as part of the 401RT Express concept. Frequency of service for some of these routes may be reduced to five minutes.

52. The 401RT Express will act as a relief valve for the Eglinton LRT if the LRTR experiences periodic or sustained overcapacity problems.

53. Suburban sprawl is eased, as development in the central area of the GTA is attracted by the 401RT Express, including construction of buildings near and at 401RT Express stations, and along intersecting arterial roadways served by enhanced bus services.

54. Property tax revenues are increased from new urban development at/near 401RT Express stations, and from increased property values in parts of Toronto, Mississauga, and Pickering, and in some '905' areas served by GO Transit.

55. For owners of real estate near 401RT Express stations, property values will increase. (Unfortunately, this also means buyers must spend more money to purchase property.)

56. Improved transit access via the 401RT Express supports an increased distribution of work across Toronto outside the downtown core and in Mississauga.

57. Rapid access to/from the 401RT Express improves automobile-free connectivity for businesses, and access for workers who live both downtown and in suburban areas.

58. Rapid transit access to places of work or to home outside the downtown core may enable the number of parking spaces downtown and across Toronto to be reduced, even as overall travel demand increases with population growth. Opportunities increase to transform public downtown parking spaces into affordable housing, open greenspaces and other public uses.

59. Overall operating revenues for the 401RT Express may cover 100% of costs or more by 2051, much better than that of Toronto's overall public transit system. The estimate assumes that 401RT Express users will pay a small premium fare than the standard fare for TTC buses.

60. Based on estimated new transit ridership generated by 2055, the overall capital cost-effectiveness of the 401RT Express would be more than twice that of Ontario's announced 2019 Rapid Transit Plan for Toronto, based on the cost per new transit trips generated.

61. Based on total new transit ridership generated by 2055, the capital cost effectiveness of the 401RT Express compared to the proposed High-Speed Rail (HSR) service from Toronto to Windsor would be approximately 14 times that of the relatively lightly-used HSR.

62. For Mississauga's residents, the 401RT Express through downtown Mississauga would enable affordable access to destinations to and from the airport area and across Toronto, and generate modal shifts to public transit that would reduce growing congestion on Highway 403 to/from Toronto.

63. The operational revenue-to-cost ratio of the Hazel McCallion LRT in Mississauga is improved as intersects with the 401RTX at two points attracts additional new ridership; additional high-density urban development at and near Hurontario Street is supported.

Cost-Sharing Options	Gross Cost (\$millions)	Federal Cost-Sharing	Net Ontario Cost (\$millions)
Highway 401 Tunnel	90,000	0%	90,000
	401RT Express	40%	41,000
	Cost Savings		49,000

The 401RT Express may be cost-shareable as a Build Canada project, or as a Canada Public Transit Fund project..

Ontario Rapid Transit Plan vs. 401RT Express	New Trips (Million/yr) 2051	Infra. Cost (\$Mil)	Cost per New User
Ontario Rapid Transit Plan*	118	39,500	\$335
	436	68,400	\$157
	3.70	1.73	2.14

401RT Cost Effectiveness Advantage 2.14

* Costs of the announced \$28.5 billion have increased to approximate current values, and include the Hazel McCallion LRT, the Ontario Line, the Yonge North Subway extension, the Scarborough Subway, and the Eglinton West LRT extension to Renforth.

High Speed Rail to Windsor vs. 401RTX	Millions of New Trips/ year 2051	Gross Infra. Cost (\$Mil)	Cost per New User
HSR to Windsor	10	21,000	\$2,100
	436	62,300	\$143
	44	2.97	14.7

401RT Express is multiple times as cost effective as the HSR Toronto to Windsor, based on new transit trips generated.

64. Based on total new transit ridership generated, the 401RT Express would be extraordinarily more cost-effective than a high-Speed rail service between Quebec City and Toronto, serving ten times the number of trips at much less cost. The comparative cost effectiveness of the 401RT Express enhances arguments for federal cost sharing.

Comparing Rapid Rail Concepts	Millions of Trips /yr 2051	Gross Infra. Cost (\$Mil)	Cost per User
Alto HSR Toronto to Quebec City - Recent Estimate	40	\$90,000	\$2,250
401RT Express*	436	\$62,300	\$143
Cost effectiveness advantage of 401RT Express:		15.7	

* Excluding rolling stock

65. The alignment of the 401RT Express almost entirely above existing transportation corridors preserves existing communities as it greatly improves access to rapid transit. In comparison, the Alto HSR will disrupt communities as it bypasses them.

66. The 401RT Express at its Port Union, Whites Road, and Liverpool stations enables transfers between the Durham-Scarborough BRT and 401RT Express to speed travel for many cross-boundary commuters. The Scarborough portion of the BRT would become unnecessary.

67. In York Region, the 401RT Express would ease road congestion to and from Toronto as north-south York Region bus services connecting to the 401RT Express improve.
