

Foreword by the Chief Executive:

Maritime Radio has accumulated many years' experience in providing communications between ship and shore, around the clock and on a worldwide basis. It uses the most modern and sophisticated communications systems.

Our operational radio engineering expertise has been of considerable help to the Government in formulating policies for radio in both its national and international uses.

For many years we have been responsible for conducting ship radio surveys, and more recently radar surveys on behalf of the Government. We also examine ships' radio officers and radiotelephone operators for their Certificate of Competence.

Maritime Radio has its own highly skilled radio engineers who plan, design, construct and maintain its radio stations for maritime communications – both the internal and the external equipment. That expertise is also directly applicable in other spheres, such as point-to-point transmission, broadcasting and communications with radio installations on land vehicles and aircraft.

With this range of expertise and capability, we may be able to help your organisation overcome its communications problems. If you would like to discuss them, please contact our Commercial Manager, at the address given in this brochure.
