

Intravenous Access Services

Peripheral IV Insertion

Did You Know?

The CDC recommends replacing peripheral intravenous catheters (PIVCs) every 72 to 96 hours.

Peripheral PIVC Insertion

Our technicians provide intravenous support by inserting peripheral IV catheters (PIVCs) using sterile aseptic technique to decrease the risk of infection.

PIVC Right For Me?

PIVCs are commonly used for acute (short term) intravenous medications, fluids, and blood products.

Guided Access

Our technicians use high performance vein visualization and illumination devices for guided access to avoid patient discomfort, infiltration, and multiple sticks.

Best Brand Promise

Our "Best Brand Promise" is to utilize top of the line PIVC products. Our technicians are equipped with Becton Dickinson BD Insight™ Autoguard™ catheters.

Advantages of Care

Our Intravenous Access Services are ideal for skilled care facilities, long-term care and home bound patients with the intent to decrease hospitalizations and re-admissions.
