

Supplemental Information for Eheim 400 Air pumps

The Copepod system comes with a dual airline with control valves designed to hook up to an air pump with a single air outlet.

Thank you for purchasing an Eheim 400 air pump! This pump has two air outlets that can be controlled using the dials on the pump. Consequently, your kit will come with two airlines.

Use one air outlet for the copepod PhytoTank(s) and lower the air pressure using the dial on the pump. We will also provide extra valves in case you need more control than the pump dial provides.

Use the second air outlet for the phyto PhytoTank(s) and set the air pressure to the maximum using the dial on the pump.
