

miniDSP 2x4 (Rev A) Links

This miniDSP 2x4 is shipped with the 0.9 Vrms input sensitivity setting (Rev A). If you are experiencing signal overload distortion, you may need to switch the unit to the 2.0 Vrms (Rev B) setting for reduced sensitivity and gain. See the User Guide on how to perform the jumper change if required. Also see DSP gain structure basics: [Gain Structure 101](#).
