

miniDSP 2x4 (Rev B) Links

This miniDSP 2x4 is shipped with the 2.0 Vrms input sensitivity setting (Rev B). If you are using this unit on a preamplifier output or other low level source, you may need to switch the unit to the 0.9 Vrms (Rev A) setting for increased sensitivity and gain. See the User Guide on how to perform the jumper change if required. Also see DSP gain structure basics: [Gain Structure 101](#).
