

FOAM-OFF™ Surface Foam Remover

Removes Harmful Surface Foam From:

- Bait Tanks.
- Transport Trucks.
- Vats And Livewells.

FOAM-OFF™ Allows More Oxygen To Enter The Water-Stop Suffocating Your Fish!

Foam on the surface of any water that is holding bait is harmful. This includes live wells. Surface foam is created from any protein content in the water. Sources of protein may be fish slime, uneaten food, fecal matter, or decaying fish. Most waters holding bait tend to have foam problems at one time or another. It is vitally important that you remove this foam whenever present, to alleviate the possibility of large losses.

FOAM-OFF™ is a thick, white, totally safe liquid useful for removing and retarding the reformation of surface foam. You want to remove foam because surface foam interferes with oxygen transfer from air to water. Ninety percent of the transfer of oxygen occurs at the water's surface.

This product is very easy and economical to use and is extremely safe and non-toxic. One teaspoon treats 15 square feet of surface water area. Increase dosage if problem persists. Multiply the width of the tank times the length (all in feet) to determine square feet of a square or rectangular tank. The square feet of a circular tank is determined by multiplying 3.14 times the radius squared (radius is 1/2 the width across the top of the container).
