### Column Notes

"100% Year" The FICo and SWCD assess the snowpack in April of each year. A full or partial amount of water is allocated accordingly.  
100% means a good water year. A drier year may be 80%, a wetter year 110%.

AF AF = Acre-Foot of water. This is the common way to measure water in the U.S. It is equivalent to one acre covered one foot deep in water. This is 43,560 cubic feet of water. One cubic foot of water = 7.48 gallons. Therefore, one acre-foot equals about 325,000 gallons. If you didn't do *any* outside watering at all, this amount of water would support one American family for 2.5 years.

3 "Project Water" is U.S. Bureau of Reclamation water. This amount of water for each Lot is set by the USBR.

4 FICo water is pro-rated to each parcel by the percentage of acreage. The PVO/SSE HOA owns 80 shares of FICo water.

5 Col (3) + Col (4)

6 Share A share is equivalent to 0.01 cubic foot per second.

Share-Day A share-day is 0.01 cfs delivered for a 24 hour period.
