Professional Employment History

Research

- 2021–present** University of Michigan, Earth & Environmental Sciences - analyzed traditional stable and clumped isotope data ($\delta^{13}\text{C}$, $\delta^{18}\text{O}$, Δ_{47}/Δ_{48}) in modern and fossil seashells to reconstruct paleoclimate (i.e., reconstruct sea surface temperatures), paleoceanography (i.e., local hydrology), paleophysiology (i.e., how they precipitate their shells).
- 2018–2021 Williams College, Geosciences - measured and analyzed bulk sediment isotope data ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$) from the Bering Sea to reconstruct how the efficiency of the biological pump changed from the Pleistocene to the present.
- 2018 Woods Hole Oceanographic Institution, Marine Chemistry & Geochemistry - measured weight%, $\delta^{13}\text{C}$, and ^{14}C in foraminiferal and coccolith calcite fractions from core top sediments to interpret dissolution behavior trends.
- 2017–2018 Williams College, Chemistry - used accelerated solvent extraction (ASE), solid phase extraction (SPE), and LC-TOF/MS to quantify concentrations of perfluoro-octanoic acid (PFOA) in vegetables from Bennington, VT.
