RE: Question on Termidor treatments in voids

Hello Kristen,

Termidor® SC, WG, HE, HP and HPII formulations can be used in treatment of voids. Please reference the specific labels for the directions-for-use.

However, these termiticides also include the statement “DO NOT use this product in voids insulated with rigid foam”. This statement was inserted into the labels as required by PR-Notice 96-7.

PR Notice 96-7 is a document published by the Environmental Protection Agency that sets forth the Agency's policy with respect to certain labeling statements and minimum product performance (5 year period) for soil treatment termiticide products. Termidor® SC termiticide/insecticide & Termidor® WG termiticide/insecticide were the first termiticide labels to undergo the registration process under PR-Notice 96-7. Per the direction of this PR notice the statement was included. Label training is part of the BASF stewardship of the Termidor products and we train that voids that have rigid foam cannot be treated with these products. I suggest that ‘void’ refers to structural voids, i.e. wall, sub floor, hollow block, hollow door, rubble foundation, etc.

Please note that this restriction is required for termiticides for soil treatment. The same restriction is not placed on either the Termidor® Foam Termiticide/Insecticide or Termidor® Dry Termiticide labels.

I hope this is helpful.

Sincerely,

**Dr. Bob Davis, BCE**
