

LabCorp's COVID-19 IgG Antibody Test is Available

About the Test

- ✓ COVID-19 IgG antibody testing, also known as serology testing, checks for a type of antibody called immunoglobulin G (IgG).
- ✓ If you have been exposed to the virus that causes COVID-19, your body typically produces IgG antibodies as part of the immune response to the virus.
- ✓ It can take at least **two weeks after exposure** to develop antibodies.
- ✓ This type of COVID-19 test is for individuals who think they may have had COVID-19 and **do not currently have symptoms**.
- ✓ You can get the test through your doctor or healthcare provider.
- ✓ You have the option to get the test through LabCorp.com. While the test itself has no upfront out-of-pocket costs, there is a **\$10 non-refundable service fee for the physician order** through PWNHealth. The \$10 service fee is not submitted to insurance for reimbursement.
- ✓ To receive your test results, you will need to sign in or create a LabCorp Patient™ account.
- ✗ **This test is not an at-home test.**

Getting the test through LabCorp.com is a 3-step process.

1

**Find a
LabCorp Location**

2

**Take a Quick
Health Questionnaire**

3

**Visit a

Should I Get Tested?

This test may be right for you if you:

- ✓ Are not experiencing symptoms consistent with COVID-19; information about COVID-19 symptoms can be found on the [CDC](#) website.
- ✓ Have not experienced a fever in the past 3 days.
- ✓ Have had or suspect you have had COVID-19, but have not experienced any new symptoms in the past 10 days (these symptoms include loss of smell or taste, difficulty breathing, feeling weak or lethargic, lightheadedness or dizziness, vomiting or diarrhea, slurred speech, and/or seizures).

This test may NOT be right for you if you:

- ✗ Are feeling sick or have had a fever within the last 3 days.
- ✗ Want to understand if you currently have COVID-19.
- ✗ Have been diagnosed with COVID-19 less than 10 days ago.
- ✗ Were directly exposed to the virus in the past 14 days.
- ✗ Have a condition that weakens your immune system.

This test is only available for persons 18 years of age or older.

Antibody tests may not be able to show if you have been exposed to COVID-19 because it can take at least two weeks after exposure to develop antibodies.

Test Information

What should I expect when I take the test?

When you arrive at the LabCorp patient service center, a phlebotomist will take a blood sample. You do not need to do anything to prepare for the test.

For additional information about COVID-19 testing, visit the [FDA](#) website or [CDC](#) website.

If I get tested, what will the results tell me?

Your test results may help identify if you were exposed to the virus that causes COVID-19 and, if so, whether or not your body has developed antibodies. Although having antibodies usually gives immunity from further infection, there is not enough evidence at this time to suggest that people who have antibodies against SARS-CoV-2, the virus that causes COVID-19, are protected against future infections from the virus. Results from this test also will not provide information on whether you can spread the virus to others and is not used as a basis for diagnosis.

A variety of factors can impact the results from the antibody test including the time the test was taken after experiencing COVID-19 symptoms, the absence of or time since exposure to the virus, or the lack of an adequate immune response, which can be due to conditions or treatments that suppress immune function.

Additionally, serology (antibody) tests may detect IgG antibodies from previous exposure to coronaviruses other than SARS-CoV-2 (COVID-19). This can cause a false positive result.

Your results will be provided to you through our secure online portal to view or print. Your results will be reported to public health authorities where required by law.
