

## Sculpt your figure for a tightened and toned silhouette

Ultrasound Cavitation is an advanced scientific method of reducing fat and cellulite to contour problem areas, without the need for invasive procedures and surgery. Offering effective results on virtually any area of the body, Ultrasound Cavitation is extremely popular for targeting stubborn pockets of fat and cellulite that refuse to budge, even despite a healthy diet and exercise.

Treatments are a comfortable, non-invasive and convenient lifestyle solution for enhancing your physique and body image confidence without the hassle, pain, downtime and costs associated with surgery.

Ultrasound Cavitation can also be combined with RF Skin Tightening to tighten and tone loose skin to the face and body.

## Proven body contouring results that are:

- Non-surgical
- Painless
- Highly effective
- No downtime

fat cavitation | cellulite reduction | skin tightening

## Frequently asked questions

### What is Ultrasound Cavitation?

Ultrasound Cavitation is a breakthrough non-surgical technology that works to reduce stubborn areas of fat and cellulite. The advanced handpiece uses low frequency sound waves to target and disrupt fat cells in problem areas, breaking down the fatty tissue and allowing it to be filtered out through the body's lymphatic system.

### Can I combine Ultrasound Cavitation with RF Skin Tightening?

Yes. Ultrasound Cavitation and RF Skin Tightening work hand in hand to reduce fat and tighten loosened skin in larger areas such as thighs, arms and the abdomen.

### How many treatments will I need?

This will vary depending on the size and type of area being treated. Typically to achieve maximum results, a course of 6-10 treatments will be prescribed spaced at one week apart. Your clinician will discuss the expected number of treatments, along with expected results during your consultation.

### Are the treatments painful?

Ultrasound Cavitation and RF Skin Tightening treatments are painless, making them a popular body contouring alternative to surgery and liposuction. Treatments involve heating the targeted area in circular motions with the handpiece, so clients will experience a comfortable, warm sensation.

### Is there any downtime following treatment?

Some patients may experience redness in the treatment area initially, but this will generally pass within 1-4 hours.

For best results in Ultrasound Cavitation, it is advised you undertake 20 minutes of cardiovascular exercise following treatment to encourage lymphatic drainage and practice a healthy lifestyle.

## How it works

Low frequency sound waves are applied to the skin in the targeted area, disrupting the fatty tissue. The fatty tissue is then broken down and filtered through the body's own lymphatic system.
