

BINDRILL

BRIDGE BREAK UP

drill.

Bores Through Any Material, Gets Bulk Products Moving

EFFECTIVE, FAST

Poking, hammering and air blasting are not the answer to bulk storage flow problems. BinDrill is. It's the safe, effective way to break through bridged material in a bulk storage vessel. It's also cost effective. Fast and easy to use, it reduces lost production time and frees employees to do their jobs.

SAFE

BinDrills are operated from the top of the storage vessel, which keeps personnel safe and out of confined spaces.

EASY TO HANDLE

BinDrill breaks it down into easily-handled pieces, making set-up and movement from bin to bin quick and easy. Two models fit a variety of applications. Depths of up to 150' can be drilled, and with proper mounting, the drill can also be used from the bottom of the bin or silo.

POWERED BY HYDRAULICS

Precise, controlled, all-hydraulic power gives BinDrill the power to work its way through rock-hard materials. Only a 440 Volt 3-phase electrical hook-up is needed for use.

Together with the BinWhip, the BinDrill restores 100% vessel capacity and leaves freed material ready for use.

BinDrill gets the job done.
