How to measure an awning without a metal wrap:

A great fit can be achieved with accurate measurements.

Measure the awning in **inches**:

1. The length of the current awning from left to right(**black** arrow):

2. The awning depth/extension from the **orange** arrow on the coach rail to the **green** arrow on the first insertion point for the metal cover(it should be anywhere around 79 to 93):

3.) The depth/extension from the **green** arrow to the **yellow** arrow, that is from the first insertion point on the rollertube to the second insertion point on the rollertube, generally 3.75 inches.

4.) The depth/extension of the valance flap from **yellow** arrow to the **blue** arrow.
