

Internal Safety Locking Device (ISLD)

Instead of an external child safety cable lock we have designed a built-in safety lock right into the frame of our Big Bore derringers.

TO LOCK:

1. Push cross-bolt safety to the RIGHT to the "SAFE" position. You may have to pull the hammer back a little to take the weight of the hammer off the cross-bolt safety.
2. Insert the allen key provided in the box (.05" hex key / allen key) in the Internal Safety Locking Device (ISLD) turn clockwise until ISLD screw is firmly pressing into the cross-bolt safety. Then make sure the cross-bolt safety does not move.

TO UNLOCK:

1. Unscrew the ISLD screw counterclockwise until it stops. The ISLD screw is designed not to come out. It will stop once it has reached the back of the firing pin plate.
