

Vault Operating Architecture (VOA)

Your operating system, installed.

Vault Operating Architecture is a structured decision and execution system designed for founder-led companies where progress still routes through one person.

When execution, decisions, and delegation depend on the founder, teams slow down. Not because of talent, effort, or ambition — but because clarity and ownership haven't kept pace with growth.

VOA installs the operating structure that allows the business to move forward without constant founder intervention.

The Problem We Solve

Most founder-led companies don't have a work problem. They have an operating problem.

Common symptoms include:

- Projects stall unless the founder is directly involved
- Delegation turns into constant clarification
- Priorities shift, but nothing cleanly realigns
- Decisions escalate by default
- Accountability feels vague
- The operating system lives in the founder's head

This creates exhaustion at the top and drag everywhere else. VOA is designed to remove that bottleneck.

What VOA Is

Vault Operating Architecture is not task execution or advisory-only consulting. It is a fixed, enforceable operating system that defines:

- Decision ownership and escalation rules
- Clear accountability for outcomes
- A predictable operating rhythm
- Visible priorities and progress
- Governance that prevents rework and drift

Once installed, the business no longer depends on founder proximity to move.

What We Install

VOA installs five core components:

1. Decision Rights & Ownership:

Clear lanes for who owns which decisions, when escalation is required, and what does not need founder approval.

Decisions stop routing back to the founder by default.

2. Execution Governance:

Every initiative has a defined owner, scope, success signal, and completion trigger.

Undocumented work is not considered valid work.

3. Operating Rhythm:

Weekly, monthly, and quarterly cadences with standard agendas and review points.

Strategy is set deliberately, not re-decided in reactive meetings.

4. Reporting & Visibility:

Initiatives, priorities, and KPIs are tracked visibly so progress doesn't rely on memory or status chasing.

Leaders review exceptions, not everything.

5. Founder Capacity Protection:

Founder involvement is treated as a finite resource.

Escalations follow rules, not urgency or anxiety.

Who This Is Built For

Vault works with founder-led companies where:

- Execution, decisions, and delegation still route through one person
- The team is capable, but momentum is inconsistent
- The founder is ready to enforce structure — not just discuss it

This work is not designed for early-stage companies or teams looking for help “doing the work.” It is built for leaders who want an operating system that holds without constant oversight.

How We Work

Vault Install (Fixed Scope)

- A 4–6 week engagement where we design and install your operating architecture.
- This is the starting point for all clients.

Vault Operating Architecture (Ongoing)

- Ongoing operating leadership to maintain, refine, and evolve the system as the business grows.
- Available after a successful Install.

The Outcome

When VOA is installed correctly:

- Decisions move without bottlenecks
- Accountability is clear
- Execution speeds up
- Founder involvement becomes intentional, not constant
- The business becomes easier to run

Not because people work harder, because the system finally supports them.

Next Step

If this sounds familiar, the next step is a short fit conversation.

VOA is not for everyone.

But for the right companies, it becomes the foundation everything else builds on.
