WALL

INTERIOR TILES

WALL BACKSPLASH

The right tile can add beauty, elegance, and personality to any room. Tile comes in a wide variety of styles, colors, and finishes, making it one of the most versatile design materials available. While floor tile can sometimes be installed on walls, wall tile should never be used on floors, as it is not manufactured to withstand the weight and pressure that floor tile must endure.

In spaces that are regularly exposed to water, such as bathrooms, kitchens, or outdoor areas, it is best to select tile with a rougher, textured finish. This type of surface provides greater slip resistance compared to glossy or highly polished tiles, making it a safer and more practical choice for wet environments. Polished tiles, on the other hand, can be stunning in living rooms, entryways, or other low-moisture spaces where their reflective shine adds sophistication and depth.

*By carefully choosing the right type of tile for each space, you not only enhance the overall design of your home but also ensure safety, durability, and long-lasting beauty. Please note, the tiles in this brochure are considered to be upgraded tiles, which would require extra payment in order for you to get them. We are excited to assist you with your homebuying needs.
