

This is the typical base angle supplied by most steel building manufacturers. This angle sits right on top of the slab with the sheeting slides right up against it. There is no way to absolutely align the sheets one to the other and there is no protection from pests.

This is the formed base angle that we provide. This piece lays flat on the slab and the sheeting sits on this lip so each piece lines up exactly the same. When installed with the bottom closure strip, the sheeting is sealed.
