

Goods Aquisition And Control Solutions

GAACS

A GAACS Database is owned and used by a registered Customs Broker.

The GAACS application is designed to support all the activity that can occur when goods are being imported into the BAHAMAS. Developed with artificial intelligence (AI) in mind it uses a ZIMDATABASES environment. Residing in the cloud GAACS becomes available to users when information is required.

Access to the database is managed by the Broker.

If Broker decides to allow an Agent access to the database, it's an easy process to assign an access Key.

With a valid Key the Agent is able to work with the AI interface to the database that supports Agent processes.
