

Protect Your New Puppy!

When puppies nurse, they ingest colostrum (mother's milk) that is high in antibodies providing immediate protection to the puppy. However, the effectiveness of the maternal antibodies declines rapidly as the immune begins to mature. By 8 weeks your puppy's immune system is at its most vulnerable point.

The immune system faces significant challenges at 2 months of age. The newborns are weaned and soon after that they are moved away from their mother and siblings to live with their new family. The new environment has numerous causing bacteria and viruses that the immune system needs to defend against. These are very stressful events and it is well known that the immune system is less effective in times of stress.

The vaccine series is also started during this time period. Vaccines are most effective if the immune system can respond properly. If the immune system is distracted by combating free radicals and pathogens and it does not receive the nutrients required to keep it strong during the time of stress, the health of the puppy is at risk. The best way to stay healthy during this critical time is to provide the nutritional support required for proper immune function.

NuVet Plus® is a synergistic combination of vitamins, minerals, and antioxidants known to boost immune system function. All the ingredients are sourced in the United States and cold processed in order to maximize the potency and bioavailability of the nutrients. By including NuVet Plus® into the diet of puppies at the time of weaning, you can be confident that you are providing the nutrients required for optimal immune system performance.

**NuVet Plus® Immune System Support
Promotes Optimal Health at All Life Stages!**
