

PILLAR BEDDING

Done correctly, this makes for a perfect stress-free fit of the action into the stock, which gives you the very best accuracy possible! Solid metal pillars are machined and fitted through the stock for a more rigid assembly (aluminum or steel pillars, your choice). Barrel is free floated and the action is carefully bedded into the stock with Devcon Stainless Steel epoxy. Devcon minimally shrinks, harder than Acraglas. Finally, after the Devcon has cured, the fit is checked with a dial-indicator to ensure the fit is perfect and all stresses are eliminated for the best accuracy possible!
